

One Variable Expressions

Procedure 1. Assume the slide is in its default position and aligned with the body. Move the hairline above a number u on scale 1, and read the result $F(u)$ underneath the hairline on scale 2.

In each row of this Table, m is the number of the row, n is the number of the distinct expression being evaluated, and k is number of the pair of scales being used for that expression. $F(u)$ is the expression that is being evaluated. The last two columns list the scales used to compute $F(u)$. $\log(u)$ is the common (base 10) logarithm of u , $\text{Exp}(u) = 10^u$
