Celebrating the 400th Anniversary of William Oughtred's Invention of the Slide Rule

Robert G. De Cesaris

October 2025

Celebrating 400 Years Since the Invention of the Slide Rule

October 23 - 26, 2025

INTERNATIONAL MEETING 2025
Cambridge/Boston MA

John Napier, Baron of Merchiston (1550 – 1617)

Mirifici Logarithmorum Canonis Descriptio

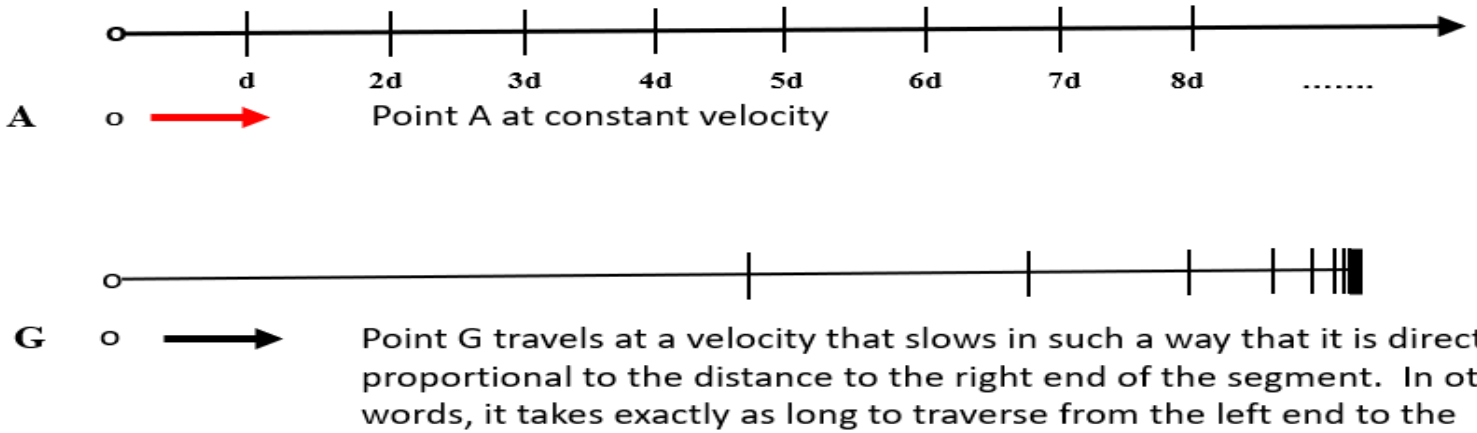
- Born in 1550, in Edinburgh, Scotland.
- Better part of his life focused on theology, developed strong anti-papal stance.
- In 1593, published his greatest theological work *Plaine Discovery of the Whole Revelation of St. John.* Predicted end of the world would occur in 1688 or 1700.

John Napier (1550 – 1617)

- Took on challenge of finding a better way to ease the tedium of computations around 1594.
- Since he knew astronomers used tables of sines most of all, initial goal was to create a table whereby the multiplication of sines could be reduced to addition.
- Published his seminal work, the Descriptio in 1614, revealing his new invention.
- Approach to describe the relationship between the sequences was one of mechanics and motion and very different from today's interpretation.

John Napier, Baron of Merchiston,
Mirifici Logarithmorum Canonis Descriptio

- Napier approached the problem as two moving points on parallel courses, moving at different velocities. He assumed a parallel ray and line segment and their relationship as follows:
  - Assume a point exists at the left end of ray A and left end of line segment G as shown
  - Now assume the point G moves to the right along the segment and the point A to the right along the ray
    - Point A moves at a constant velocity by traveling distance d in equal time intervals. Note that with each time interval, A therefore represents a constant distance over time, or equivalent to an Arithmetic sequence
    - Point G moves at an ever-decreasing velocity proportions to the distance that remains to reach the right end of the segment



Point G travels at a velocity that slows in such a way that it is directly proportional to the distance to the right end of the segment. In other words, it takes exactly as long to traverse from the left end to the halfway point, from the half-way to three-quarters point, from the three-quarters point to the seven-eighths point, etc ,etc, therefore taking an infinite amount of time to arrive at the right end. This effectively defines a geometric sequence with respect to point A

INTERNATIONAL MEETING 2025
Cambridge/Boston MA

John Napier, Baron of Merchiston,
Mirifici Logarithmorum Canonis Descriptio

- Descriptio contains 90 pages of tables and 57 pages of text describing their utility
- News spread quickly and importance recognized by mathematicians Henry Briggs and Edward Wright. Early Latin editions published 1614, 1619, and 1620.
- Briggs' visited Napier in 1615 and 1616 to discuss rescaling the tables to make them easier to use, ' including defining the logarithm of 1 equal to 0 and that of 10 as 1, 'common' logarithms as we know them today.
- With Napier's death in 1617, project of completing new tables left completely to Briggs. Briggs published the first 3 sections (of 10) with the title *Arithmetica Logarithmica,* in 1624.

Henry Briggs (1561 – 1630)

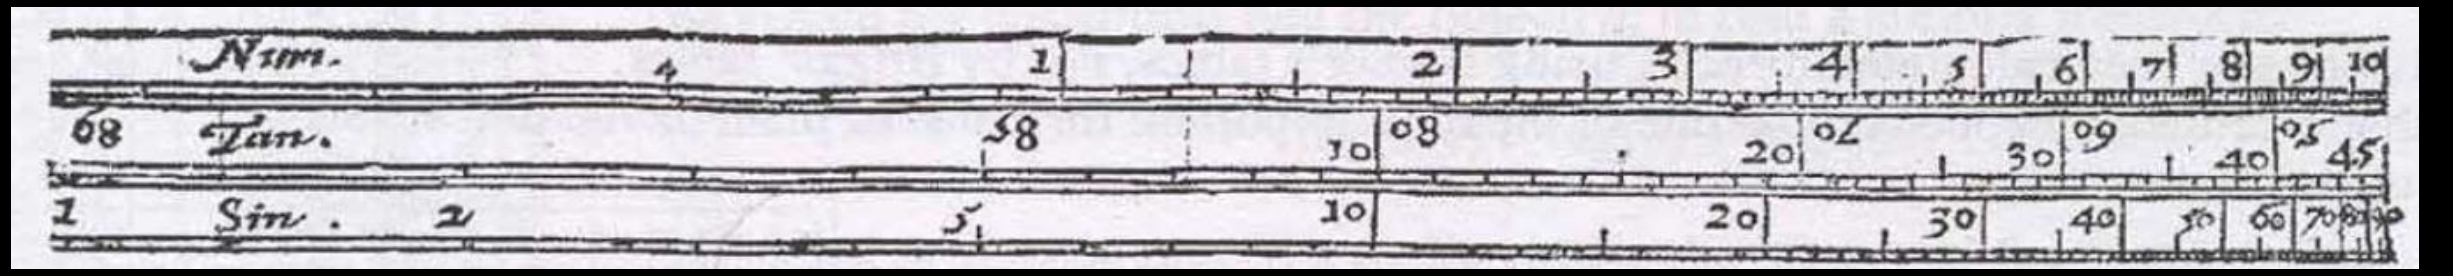
1620 Edition of Napier's Descriptio, Earliest Tables Commonly Available to Collectors

Edmund Gunter (1581 – 1626)
Inventor of the Gunter Scale

- Rector of St. George's Church in Southwark and Professor of Astronomy at Gresham College
- Published his first set of logarithm tables in 1619.
- Felt that logarithm tables were cumbersome and recognized that many simple navigational problems did not require extreme accuracy.
- Being familiar with the use of dividers for making calculations using a sector, he devised a new set of scales where the numbers were separated by logarithmic scale distances.
- Called his new basic logarithmic scale the 'Line of Numbers' and also proposed adding logarithmic sine and tangent scales so that the important navigational 'Line of Sines' could be easily calculated.

Edmund Gunter (1581 – 1626)

Edmund Gunter (1581 – 1626)
Inventor of the Gunter Scale

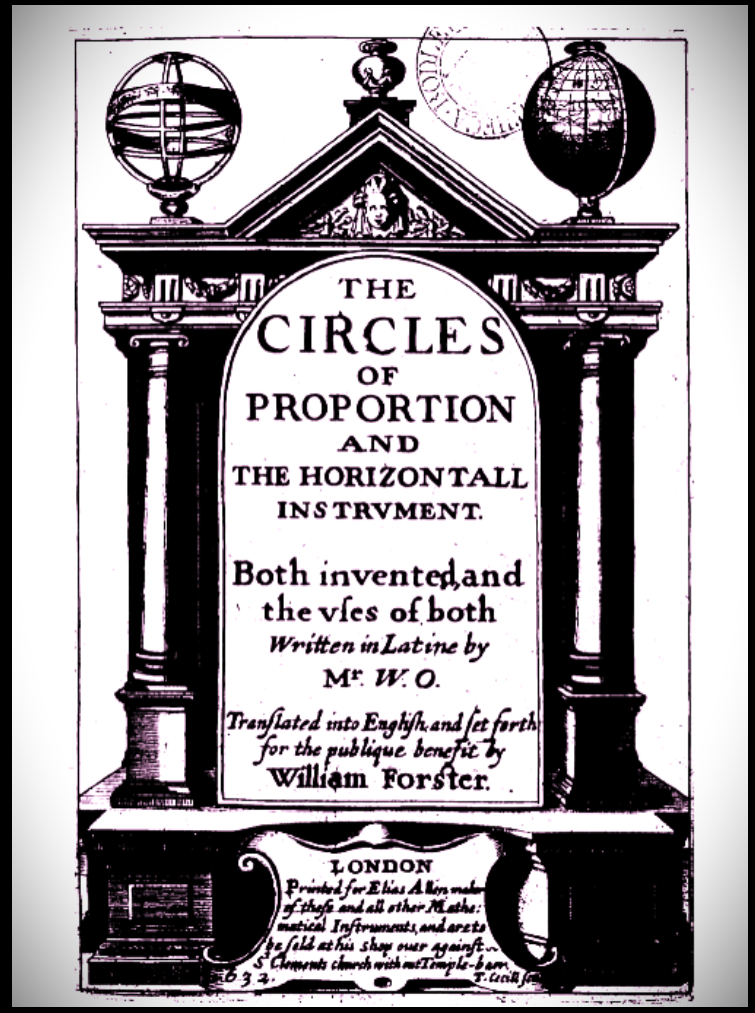


Original Drawing of Gunter's Scale with Three Types of Logarithmic Scales

Example of a Typical 19th Century 20 Inch Gunter Scale with Gunter's Initial Scales and Numerous Other Additional Scales Later Proven Useful in Navigation

William Oughtred (1574 – 1660)
Inventor of the Logarithmic Slide Rule

- Anglican clergyman and English mathematician
- First to recognize that two equivalent Gunter scales in circular form or as straight scales could be used to perform multiplication and division.
- Oughtred used this strictly as a tool for teaching mathematical concept with no pursuit of other practical applications
- Published *The Circle of Proportion and the Horizontall Instrument* in 1632
- In his publication he refers to a horizontal sundial integrated into the reverse side of the Circle of Proportions.
- In his 1632 work he refers to having conceived of the circle some years earlier, but without specifics as to actual year.



The Circle of Proportions and the Horizontall Instrument that Introduced the Slide Rule to the World (1632)

William Oughtred (1574 – 1660)
Inventor of the Logarithmic Slide Rule

- Anglican clergyman and English mathematician
- First to recognize that two equivalent Gunter scales in circular form or as straight scales could be used to perform multiplication and division.
- Oughtred used this strictly as a teaching tool with no intent of making it a tool for the trades.
- Published *The Circle of Proportions and the Horizontall Instrument* in 1632
- In his publication he refers to a horizontal sundial integrated into the reverse side of the Circle of Proportion.
- In his 1632 work he refers to having conceived of the circle some years earlier, but without specifics as to actual year.
- It is well-known that he was using this concept as a teaching tool with his students in the second half of the 1620's.
- Best estimation is concept occurred between 1622 and 1628.....so we celebrate 400 years in 2025!

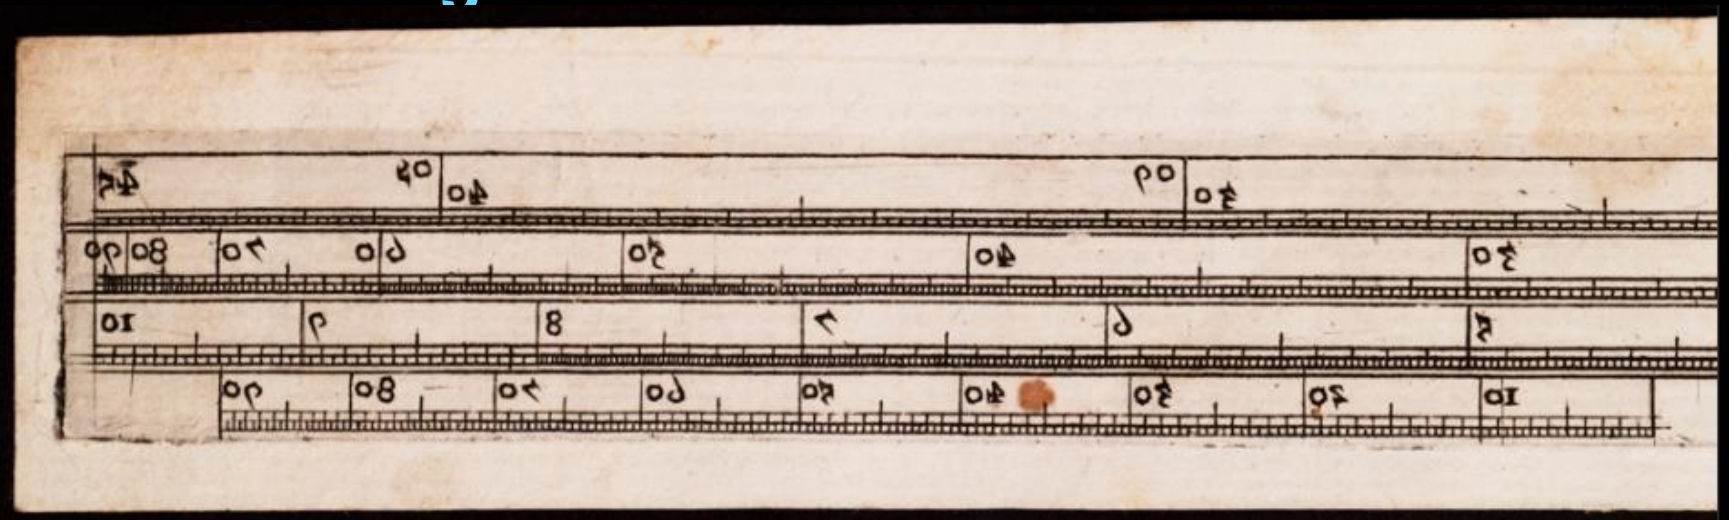
The Circle of Proportions and the Horizontall Instrument that Introduced the Slide Rule to the World (1632)

The ‘Circle of Proportion’

An Early Example of Oughtred’s ‘Circle of Proportion’, by Elias Allen, c. 1633 – 1640 **[Harvard University Putnam Gallery]**

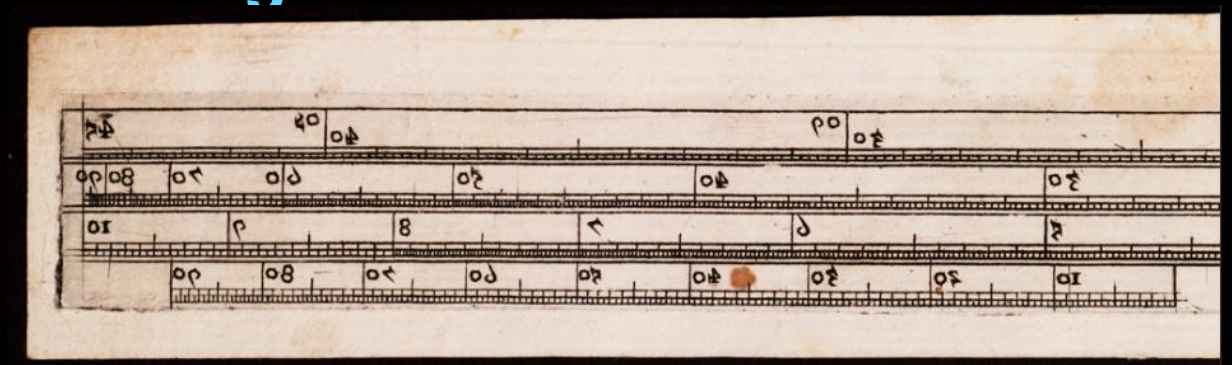
Oughtred's Linear Slide Rule



Reverse Print by Elias Allen, Part of Oughtred's First Linear Rule [Macclesfield Collection, Cambridge University Library

- An important letter from 1638 was recently discovered as part of the Macclesfield Collection in the Manuscripts Room of Cambridge University Library.
- The letter, from William Oughtred to instrument maker Elias Allen, was accompanied by the reverse print above which is a reverse ink print of the earliest discovered example of Oughtred's linear slide rule.
- The letter describes the linear rule and notes that he (Oughtred) 'would gladly see one of [the two parts of the instrument] made of brass.

Oughtred's Linear Slide Rule



The Official Story of it's Discovery (from Cambridge University Library):

"Dr Boris Jardine's Munby Fellowship was held during the 2014-2015 academic year. His project focused on "The book as instrument 1570-1720," exploring the interplay between printing, engraving, and scientific instruments like slide rules. During this time he made key discoveries of William Oughtred's linear slide rule in the Macclesfield Collection, finding the earliest known example of Oughtred's linear rule, a reverse paper print made by the instrument maker, Elias Allen."

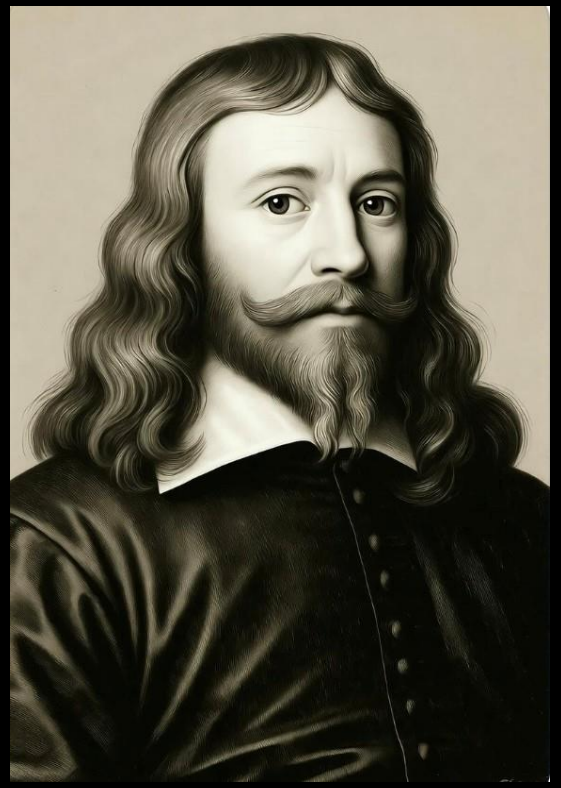
....so now you know 'the real the story"!

The Controversy Over Invention

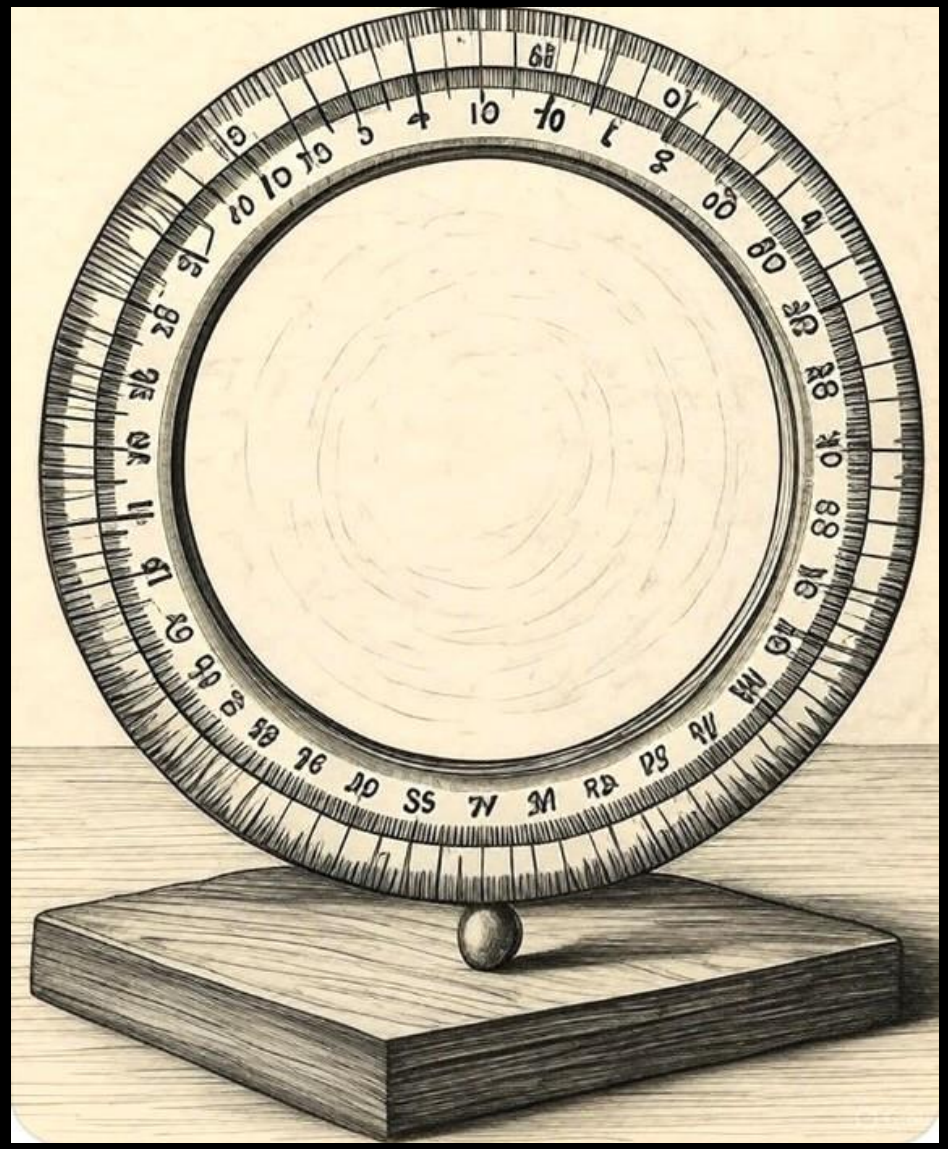
- A very bitter and prolonged struggle, ripe with accusations between Oughtred and Richard Delamain, took place in the 1630s over priority of invention
- Oughtred routinely shared his circular rule prototypes privately with his students in the mid-to-late 1620's with the goal of mathematical instruction.
- Fortunately, Oughtred also shared his ideas with renowned instrument-maker Elias Allen (but did not publish at the time)
- Richard Delamain, a mathematician 26 years younger and a student of Oughtred's in the 1620's, in 1629 sent a manuscript entitled *Grammelogia or The Mathematical Ring* to King Charles I.
- He then formally published his work in 1630, claiming invention of this instrument, including designs for circular slide rules



Richard Delamain (1600-1644)

The Controversy Over Invention

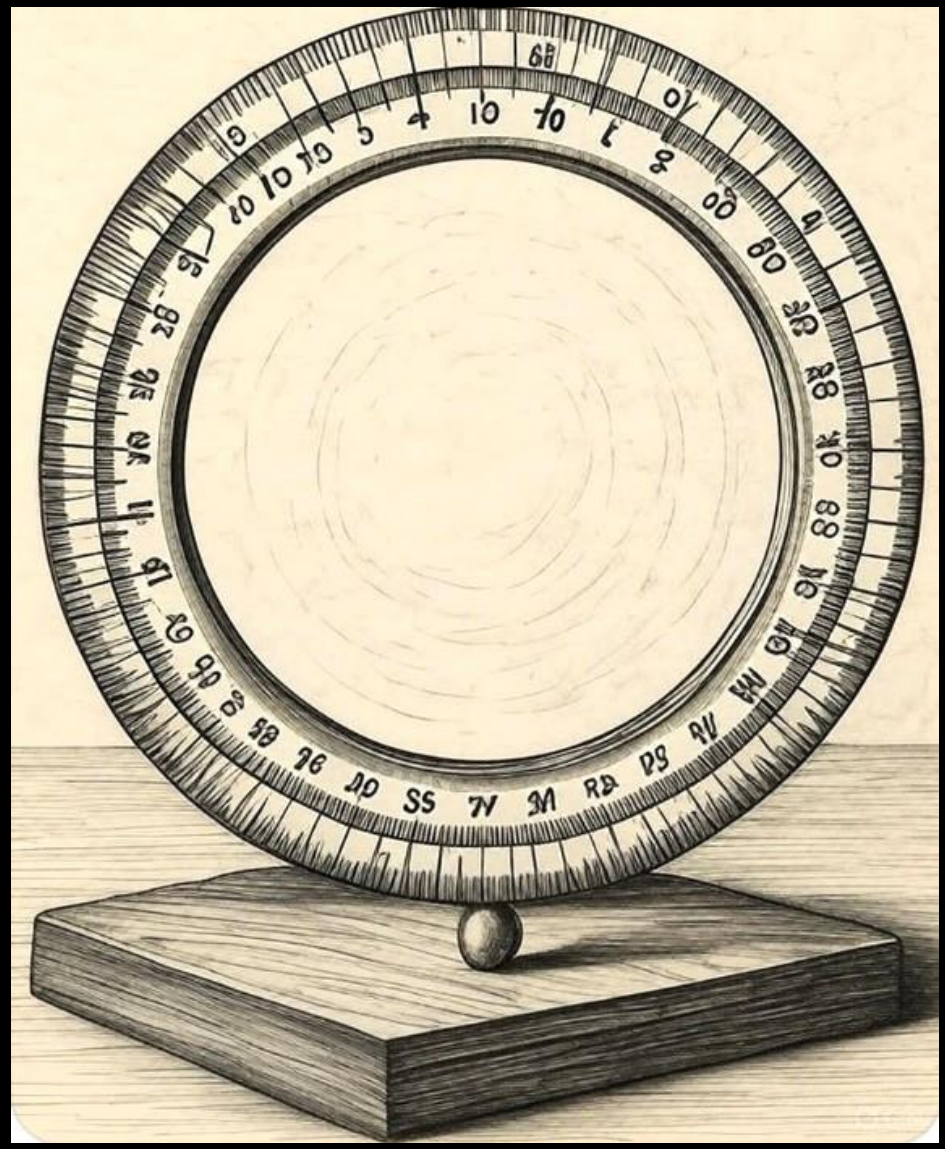
- Delamain demonstrates his invention to King Charles I who grants him a 10-year Royal Patent and appoints him as Royal Engineer and tutor to the King.
- Oughtred privately accuses Delamain of theft.
- William Forster, a loyal student of Oughtred's, translates Oughtred's unpublish Latin manuscript into English and publishes *The Circles of Proportion and the Horizontall Instrument* in 1632. In it, an unnamed rival (obviously Delamain) is accused of attempting to 'preocupate' Oughtred's work after confidential sharing of his ideas.



Richard Delamain's 'Grammelogia or The Mathematical Ring' 1630

The Controversy Over Invention

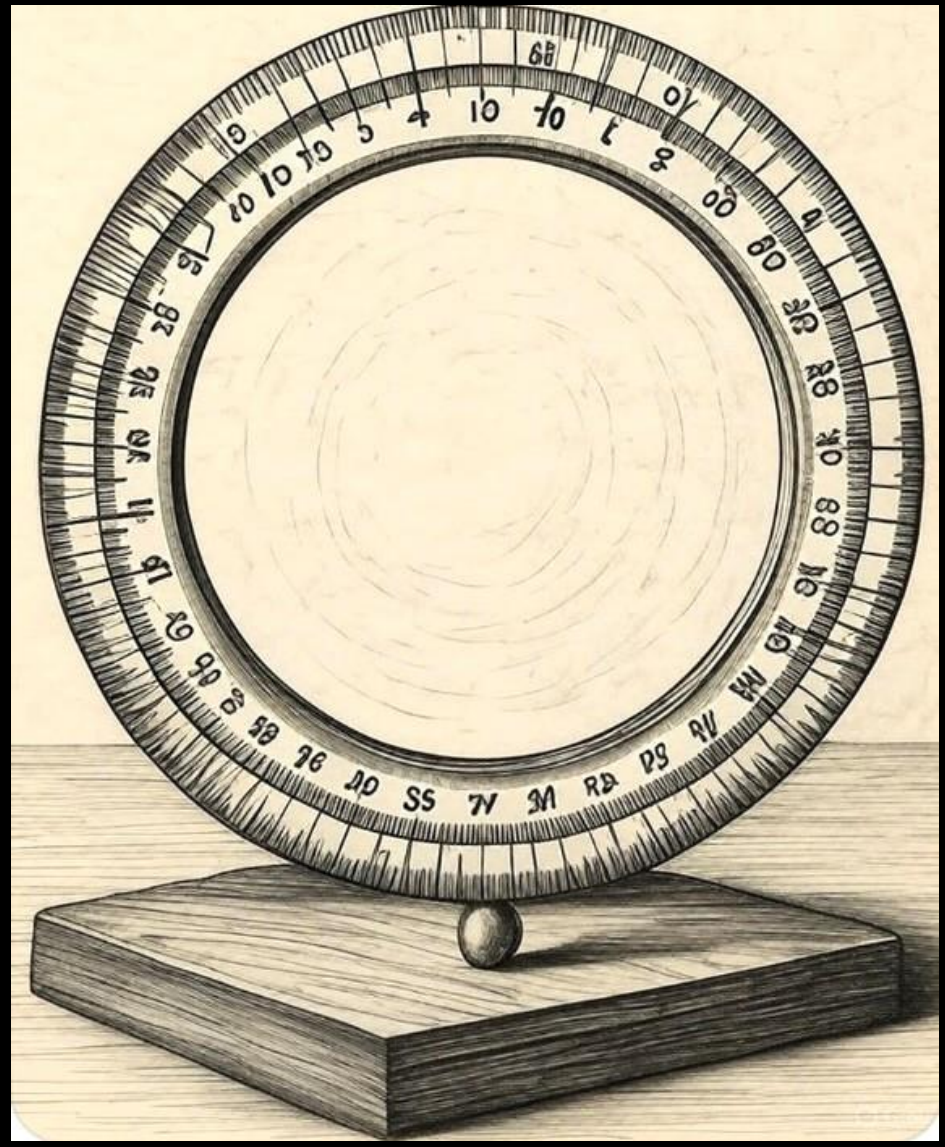
- **Delamain fights back by publishing three new editions of his Grammelogia, adding sine/tangent circles and claiming accuracy enhancements. Independently, he accuses Oughtred of false timelines and a false disdain for practical instruments.**



Richard Delamain's 'Grammelogia or The Mathematical Ring' 1630

The Controversy Over Invention

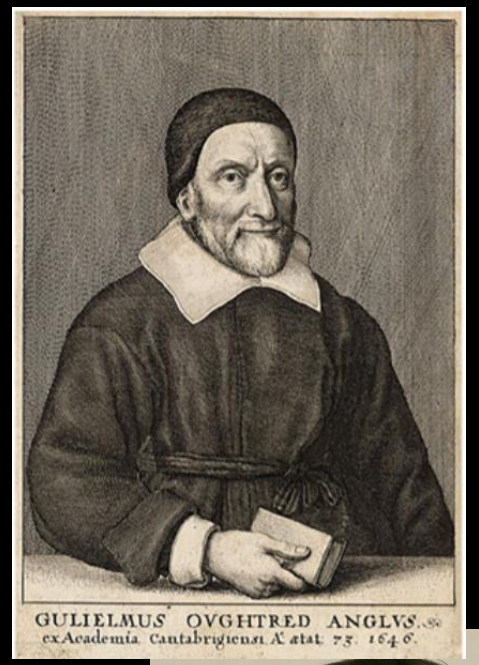
- Delamain fights back by publishing three new editions of his Grammelogia, adding sine/tangent circles and claiming accuracy enhancements. Independently, he accuses Oughtred of false timelines and a false disdain for practical instruments.
- Oughtred publishes *An Addition vnto the Vse of the Instrument called the Circles of Proportion* where he also expands on his ideas of the linear rule.

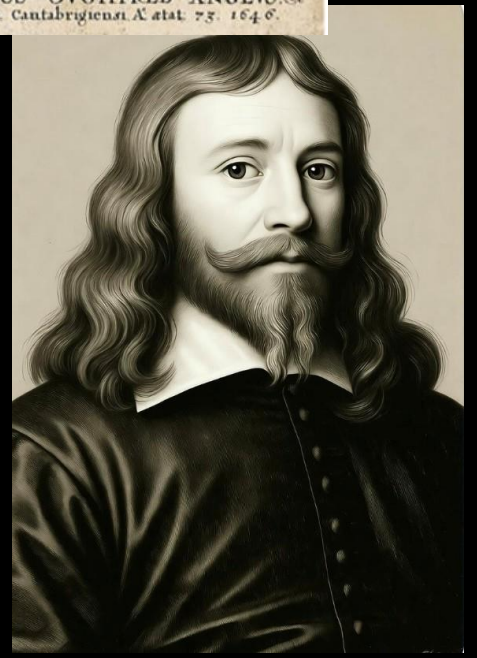


Richard Delamain's 'Grammelogia or The Mathematical Ring' 1630

The Controversy Over Invention

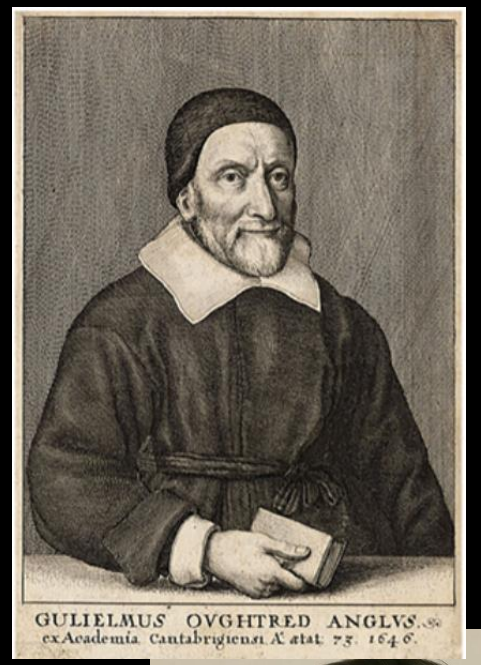
- **Excerpts from Oughtred's *Apologeticall Epistle*....**
  - **'To the English Gentrie and all other studious of the Mathematicks, which shall bee Readers hereof. The just Apologie of Wil: Oughtred, against the slanderous insimulations of Richard Delamain, in a Pamphlet called Grammelogia or the Mathematicall Ring...'**
  - **[Delamain is] 'already corrupted with doting upon instruments, and quite lost from ever being made an Artist'**
  - **'His Booke is an untimely birth, a hotch-potch of confusion full of grosse errors and absurdities'**

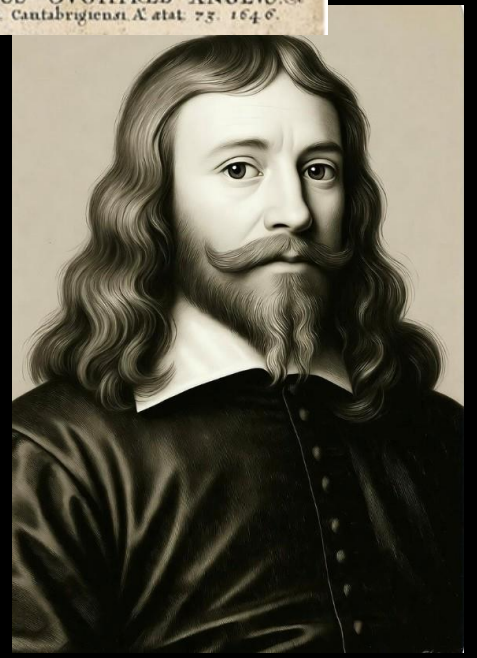




The Controversy Over Invention

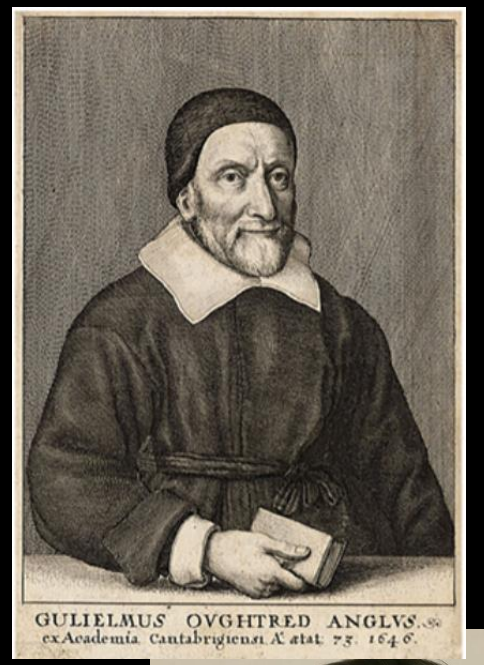
- **Excerpts from Oughtred's *Apologeticall Epistle*....**
  - **'To the English Gentrie and all other studious of the Mathematicks, which shall bee Readers hereof. The just Apologie of Wil: Oughtred, against the slanderous insimulations of Richard Delamain, in a Pamphlet called Grammelogia or the Mathematicall Ring...'**
  - **[Delamain is] 'already corrupted with doting upon instruments, and quite lost from ever being made an Artist'**
  - **'His Booke is an untimely birth, a hotch-potch of confusion full of grosse errors and absurdities'**
  - **'What he hath done is but a shadow of my work, patched together with stolen fragments... a pickpurse of another man's wit'**

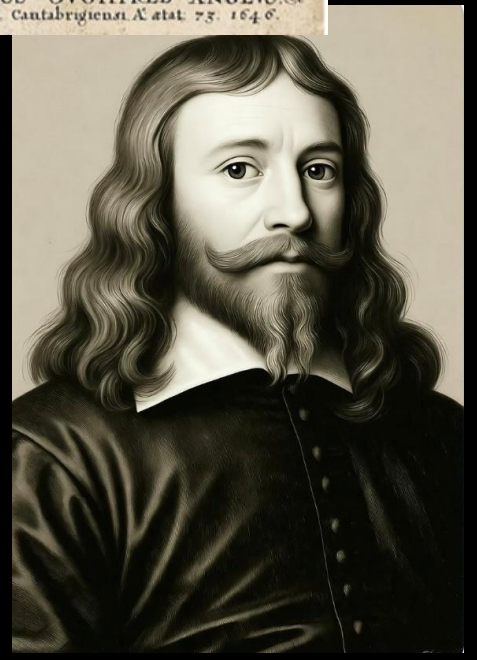




The Controversy Over Invention: Conclusion

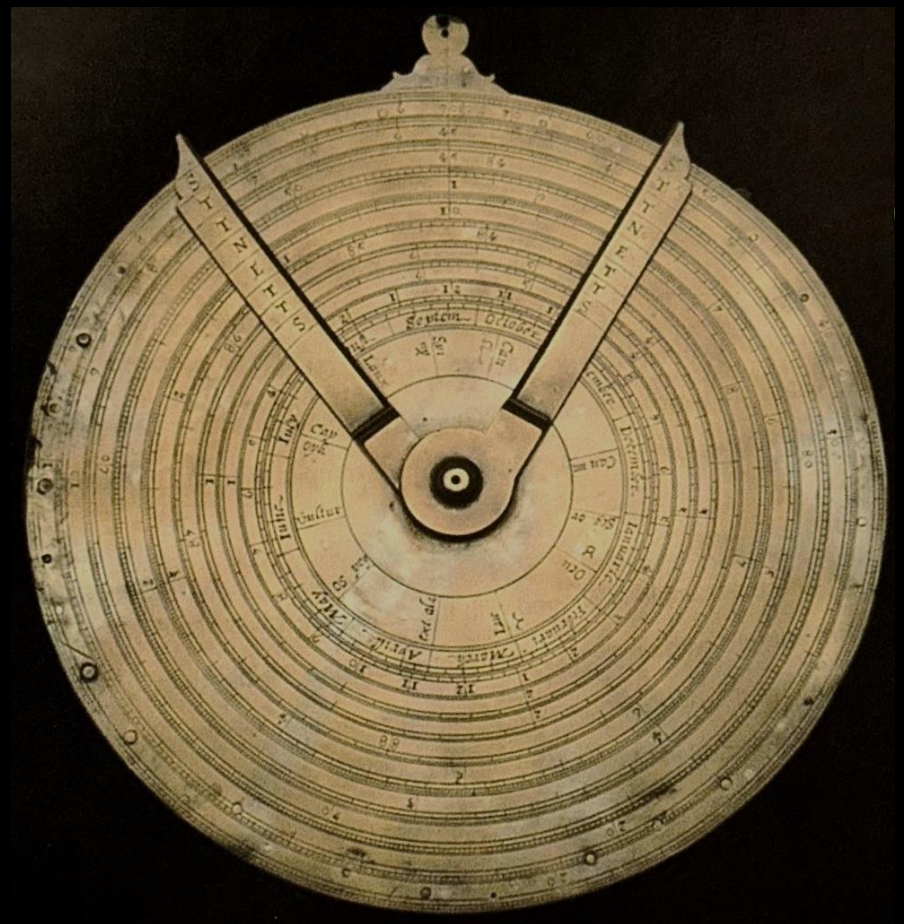
- Based on several important mathematicians who backed Oughtred's claim to earlier conceptual priority, invention of the slide rule is widely attributed to Oughtred
  - Supported by William Forster, Elias Allen. John Brown and later important figures such as William Leybourn, Robert Boyle and Isaac Newton
- King Charles favored Delamain, appointing him as Royal Tutor at a salary of £100 per year (£29000 or $39000 in 2025). He was impressed with Delamain's pamphlets and his gifts which included a silver ring-sundial and other instruments.
- Prominent historian Florian Cajori summarized the conclusion well: though Delamain was first to publish with a focus on practical application, Oughtred proved conceptual priority for both the circular and linear slide rule as evidenced by his mastery and by key witnesses.





William Oughtred's Legacy.....

Another beautiful example of Oughtred's Circle of Proportion



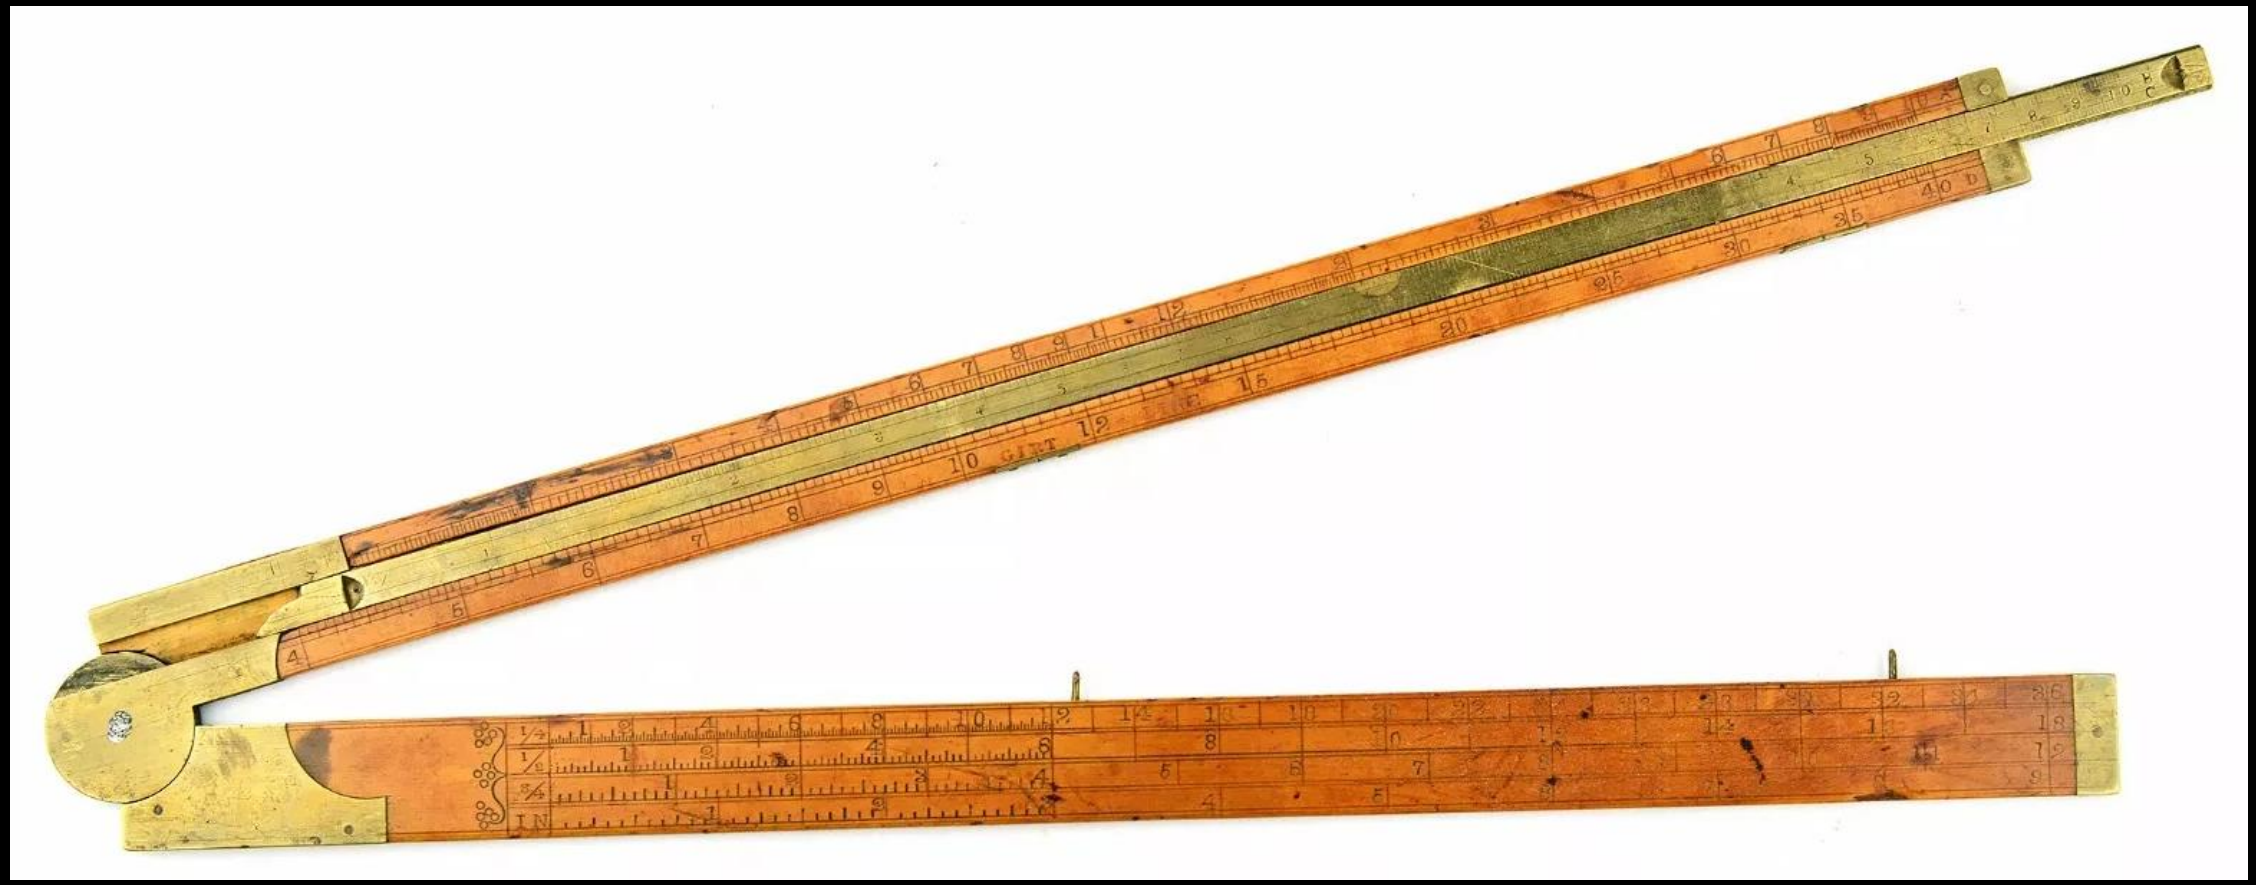
Circle of Proportion by maker Robert Davenport ca. 1650
[National Museum of Scotland}

INTERNATIONAL MEETING 2025
Cambridge/Boston MA

William Oughtred's Legacy.....

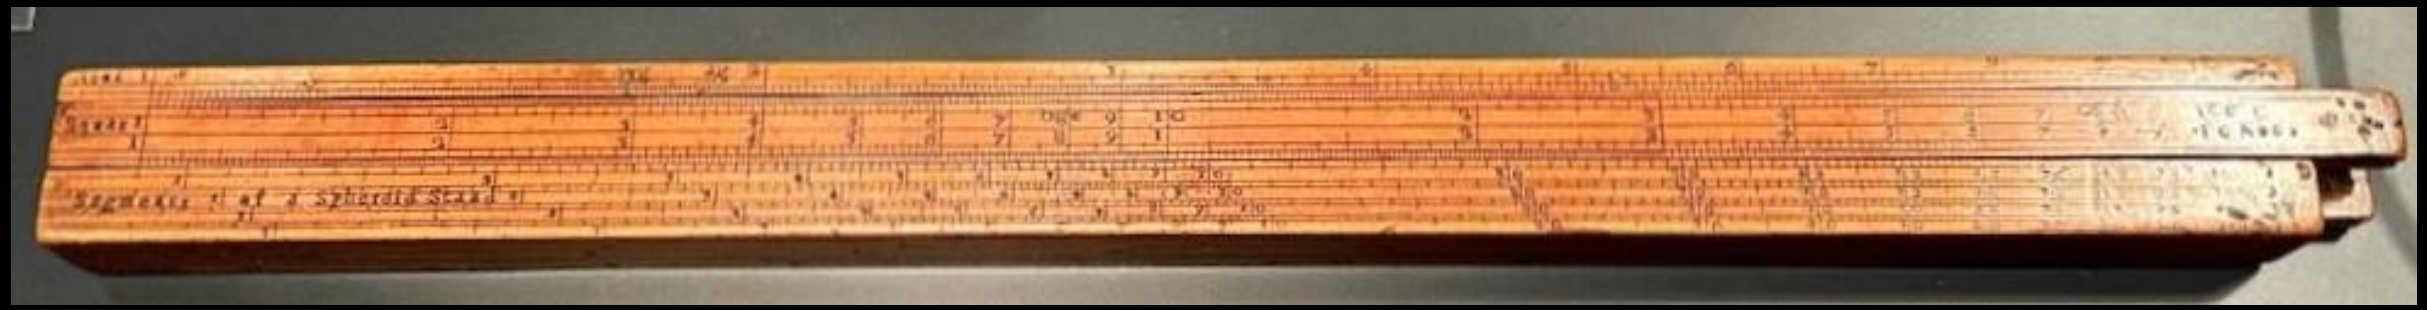
The Coggeshall or Carpenter's Slide Rule, 1677

Henry Coggeshall (1623 – 1690)



William Oughtred's Legacy.....

The Everard Gauging Rule, 1683, Thomas Everard (1620 - 1680)

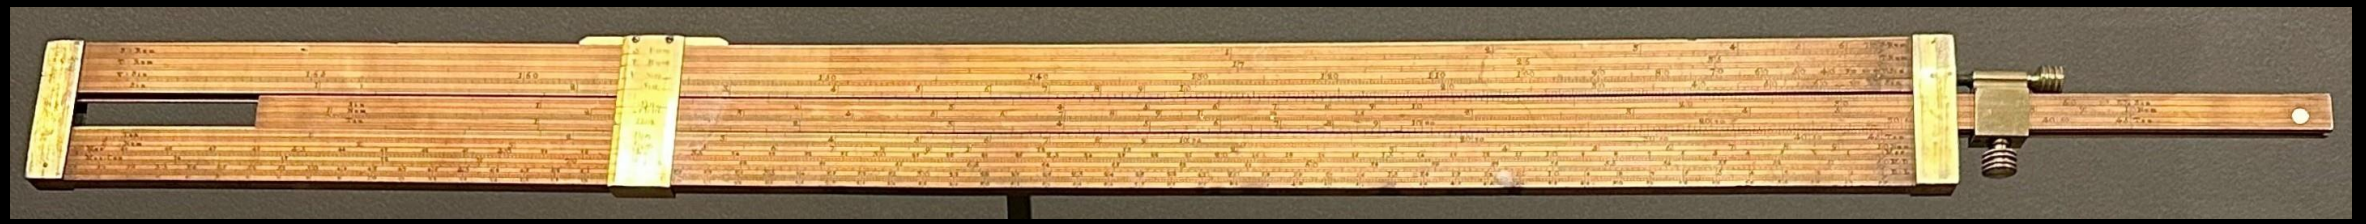


William Oughtred's Legacy.....

A Variety of Everard Excise Rules from the Late 17th to the Mid-19th Centuries

William Oughtred's Legacy.....

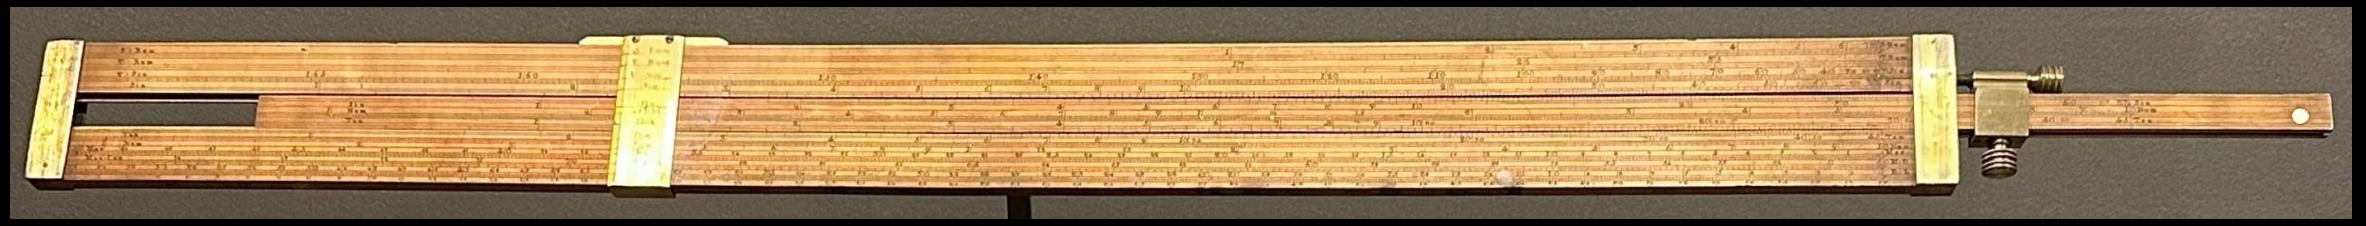
Defined Clear Stator and Slide 1657, Seth Partridge (1603 – 1686)



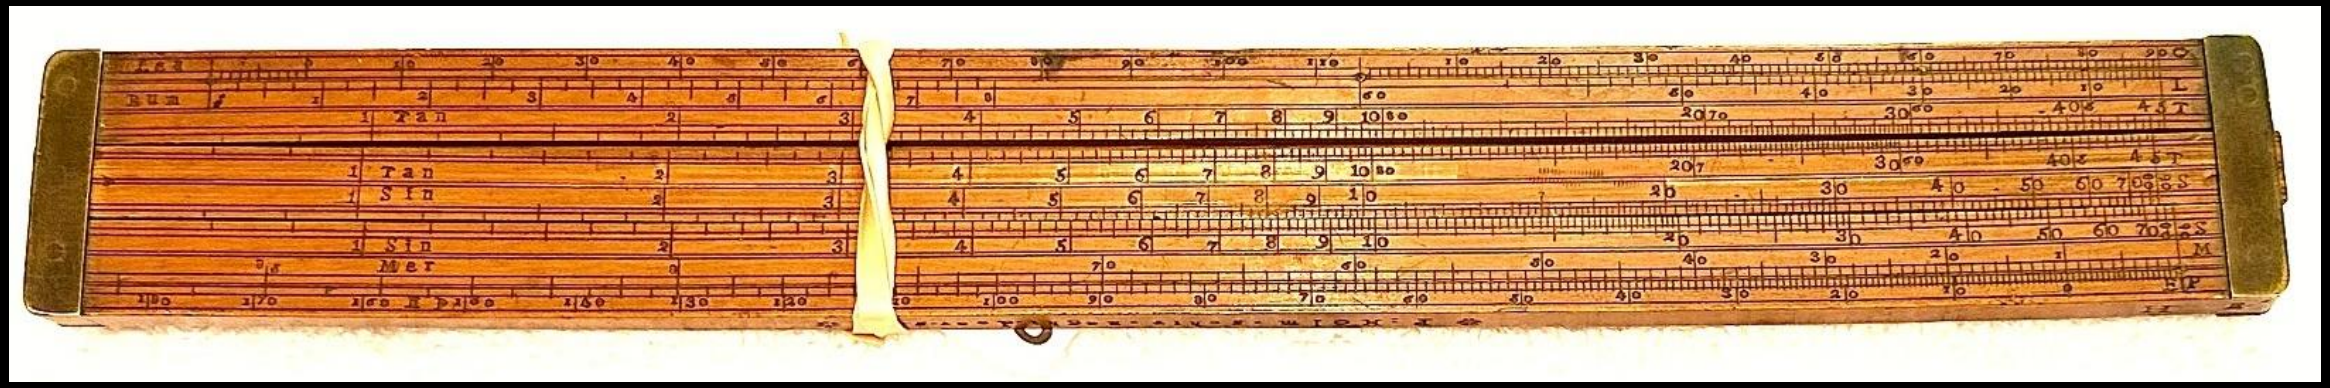
The Sliding Gunter, 1775, John Robertson (1712 – 1776)

William Oughtred's Legacy.....

Defined Clear Stator and Slide 1657, Seth Partridge (1603 – 1686)

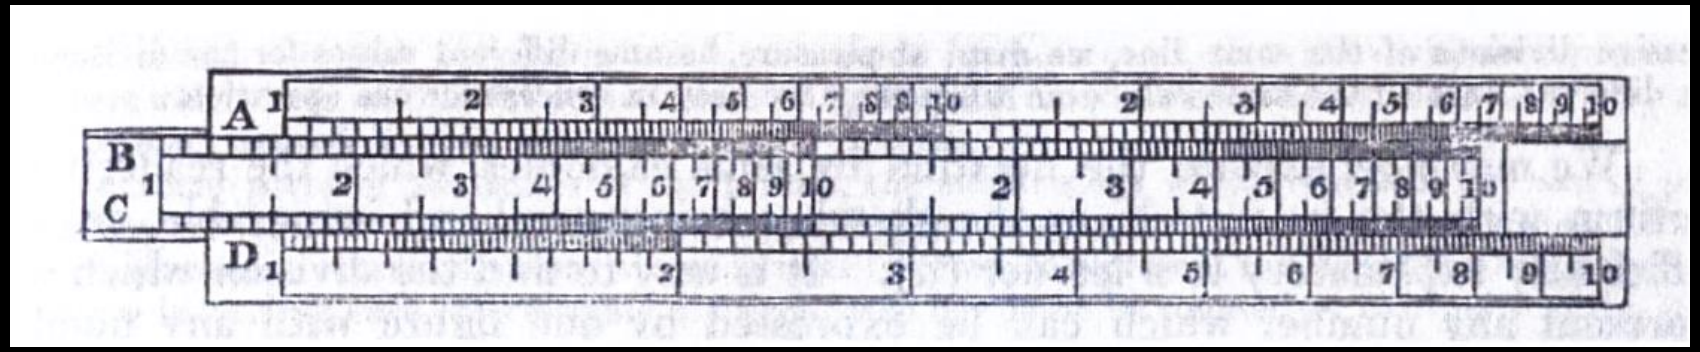


The Sliding Gunter, 1775, John Robertson (1712 – 1776)



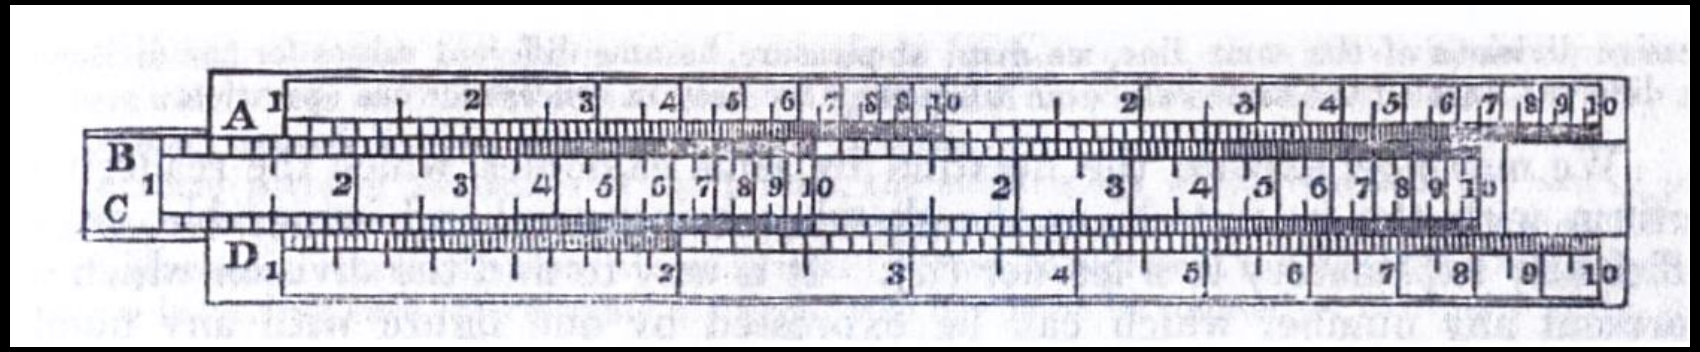
William Oughtred's Legacy.....

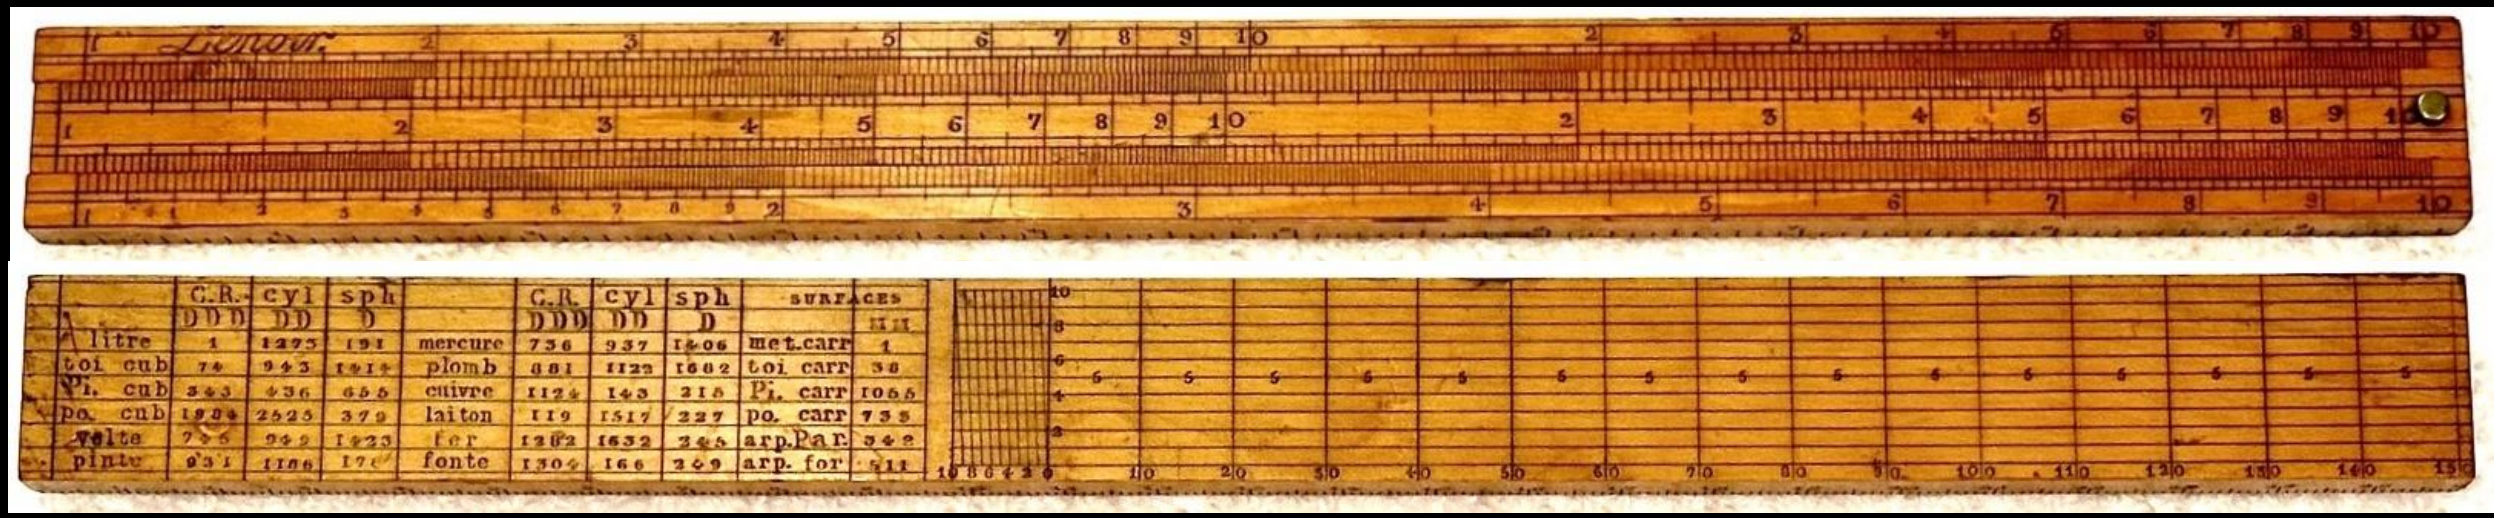
The Soho Slide Rule (Engineer's Rule), 1770's
James Watt (1736 – 1819)



William Oughtred's Legacy.....

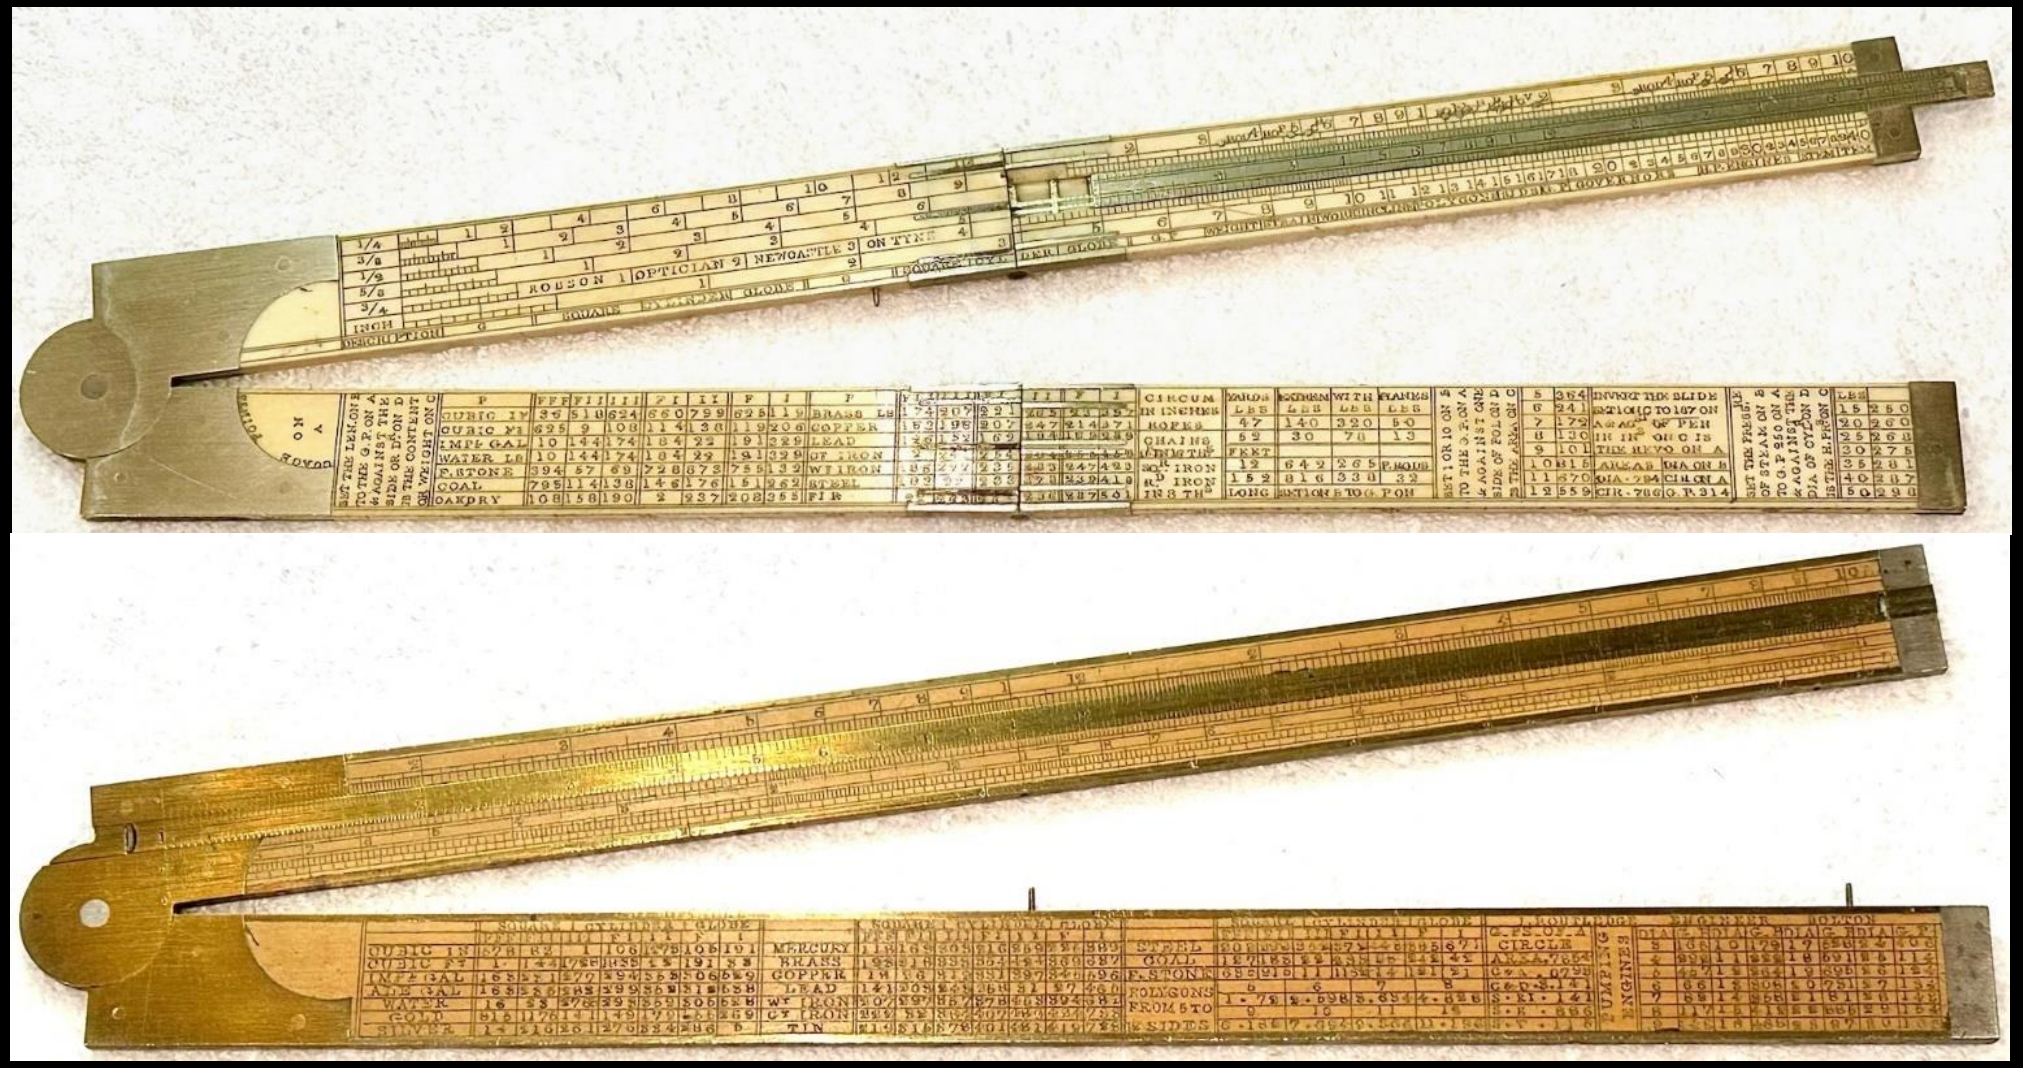
The Soho Slide Rule (Engineer's Rule), 1770's
James Watt (1736 – 1819)





William Oughtred's Legacy.....

Routledge Engineer's Rule 1809
Joshua Routledge (1773 – 1829)



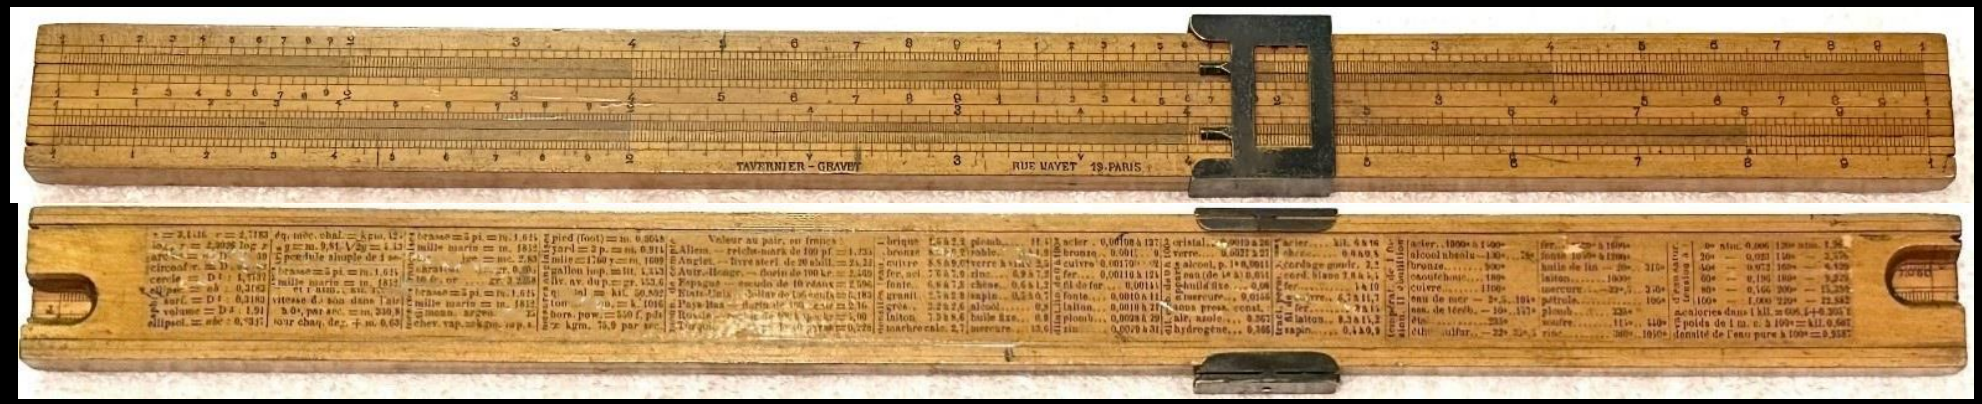
William Oughtred's Legacy.....

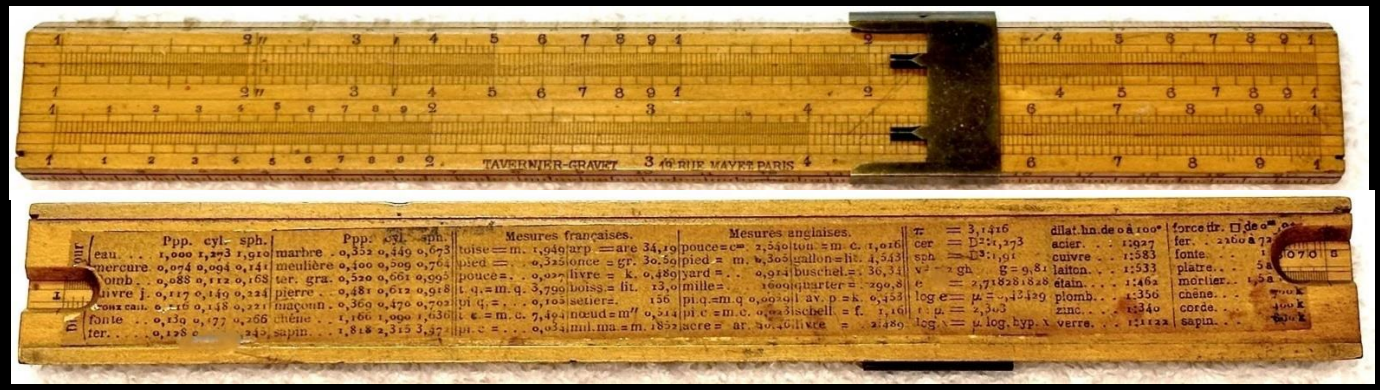
The Mannheim Slide Rule, 1859 Amadee Mannheim

Amédée Mannheim
(1831 – 1906)

William Oughtred's Legacy.....

The Mannheim Slide Rule, 1859 Amadee Mannheim



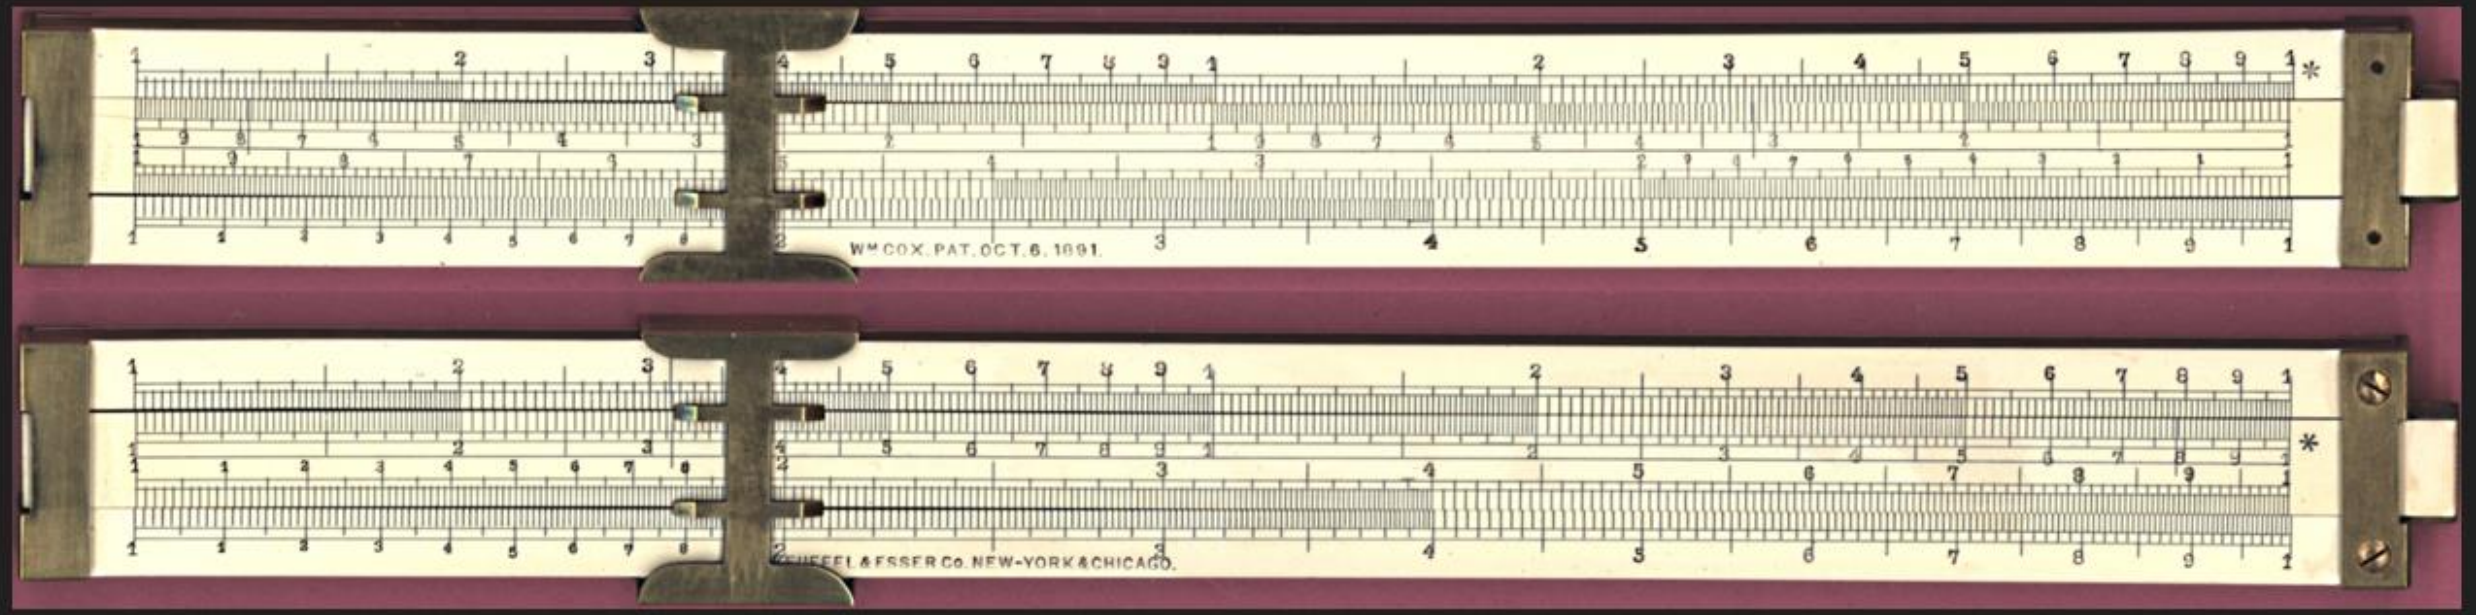


Amédée Mannheim
(1831 – 1906)

INTERNATIONAL MEETING 2025
Cambridge/Boston MA

William Oughtred's Legacy.....

The Duplex Slide Rule, 1891 William Cox (1848 – 1907)



William Oughtred's Legacy.....

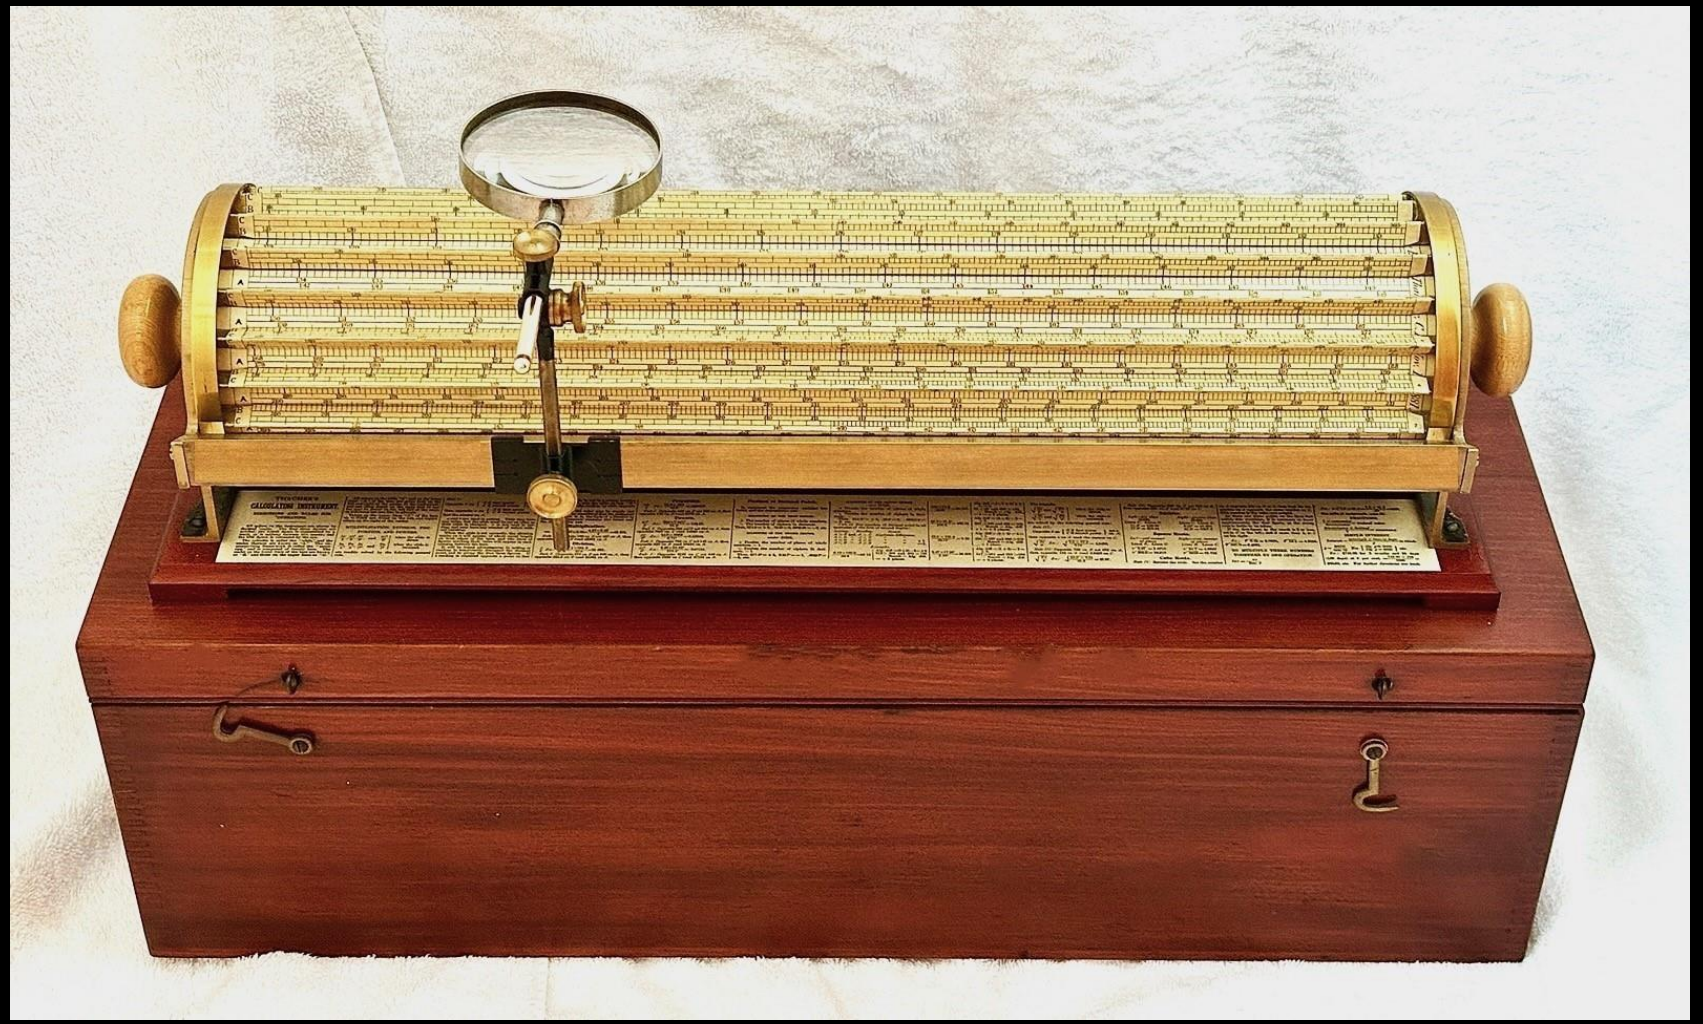
The Fuller Cylindrical Calculator, 1878, George Fuller (1829 – 1907)

William Oughtred's Legacy.....

The Fuller Cylindrical Calculator, 1878, George Fuller (1829 – 1907)

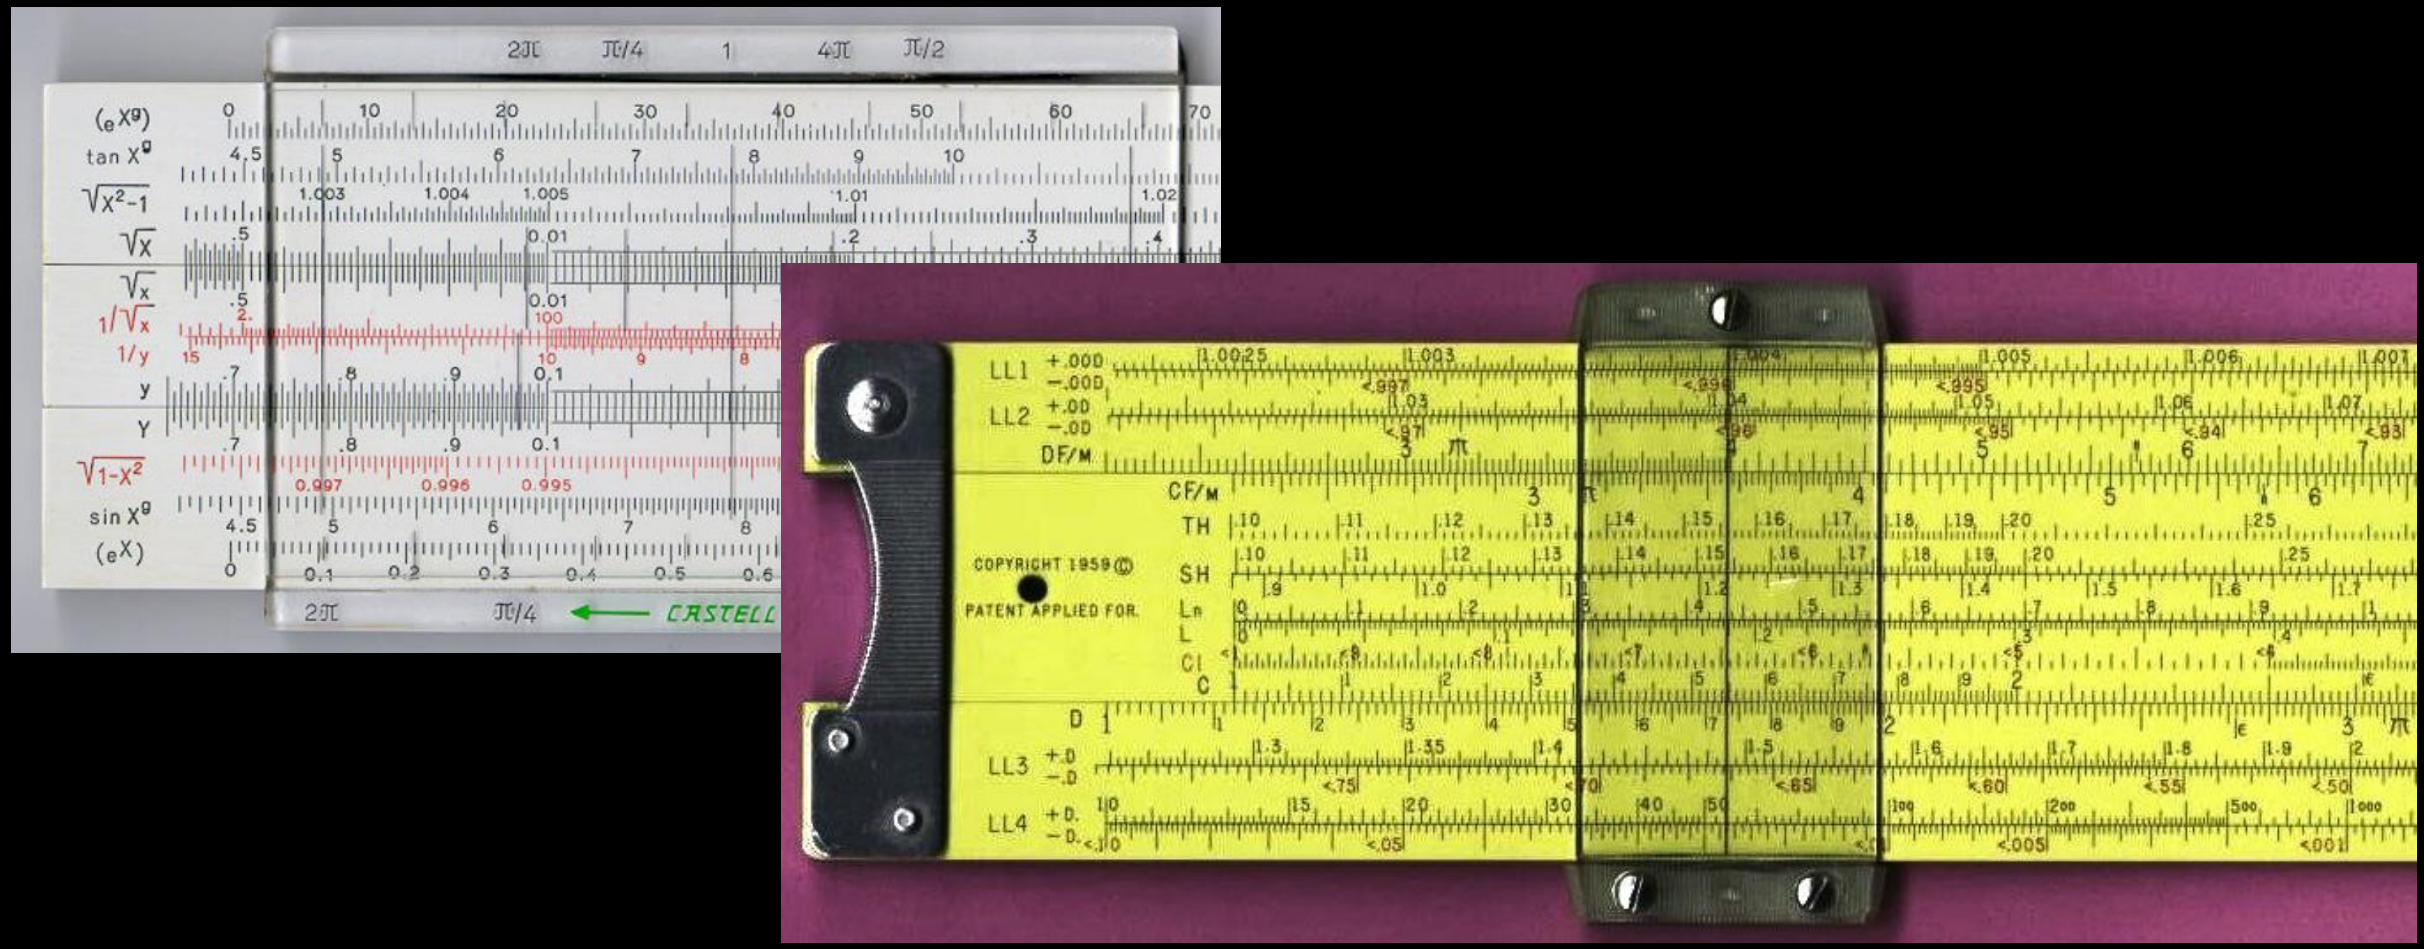
William Oughtred's Legacy.....

The Thacher Calculator, 1881, Edwin Thacher (1839 – 1920)



William Oughtred's Legacy.....

Two Interesting Complex Rules in Production in the mid-20th Century



INTERNATIONAL MEETING 2025
Cambridge/Boston MA

William Oughtred's Legacy.....

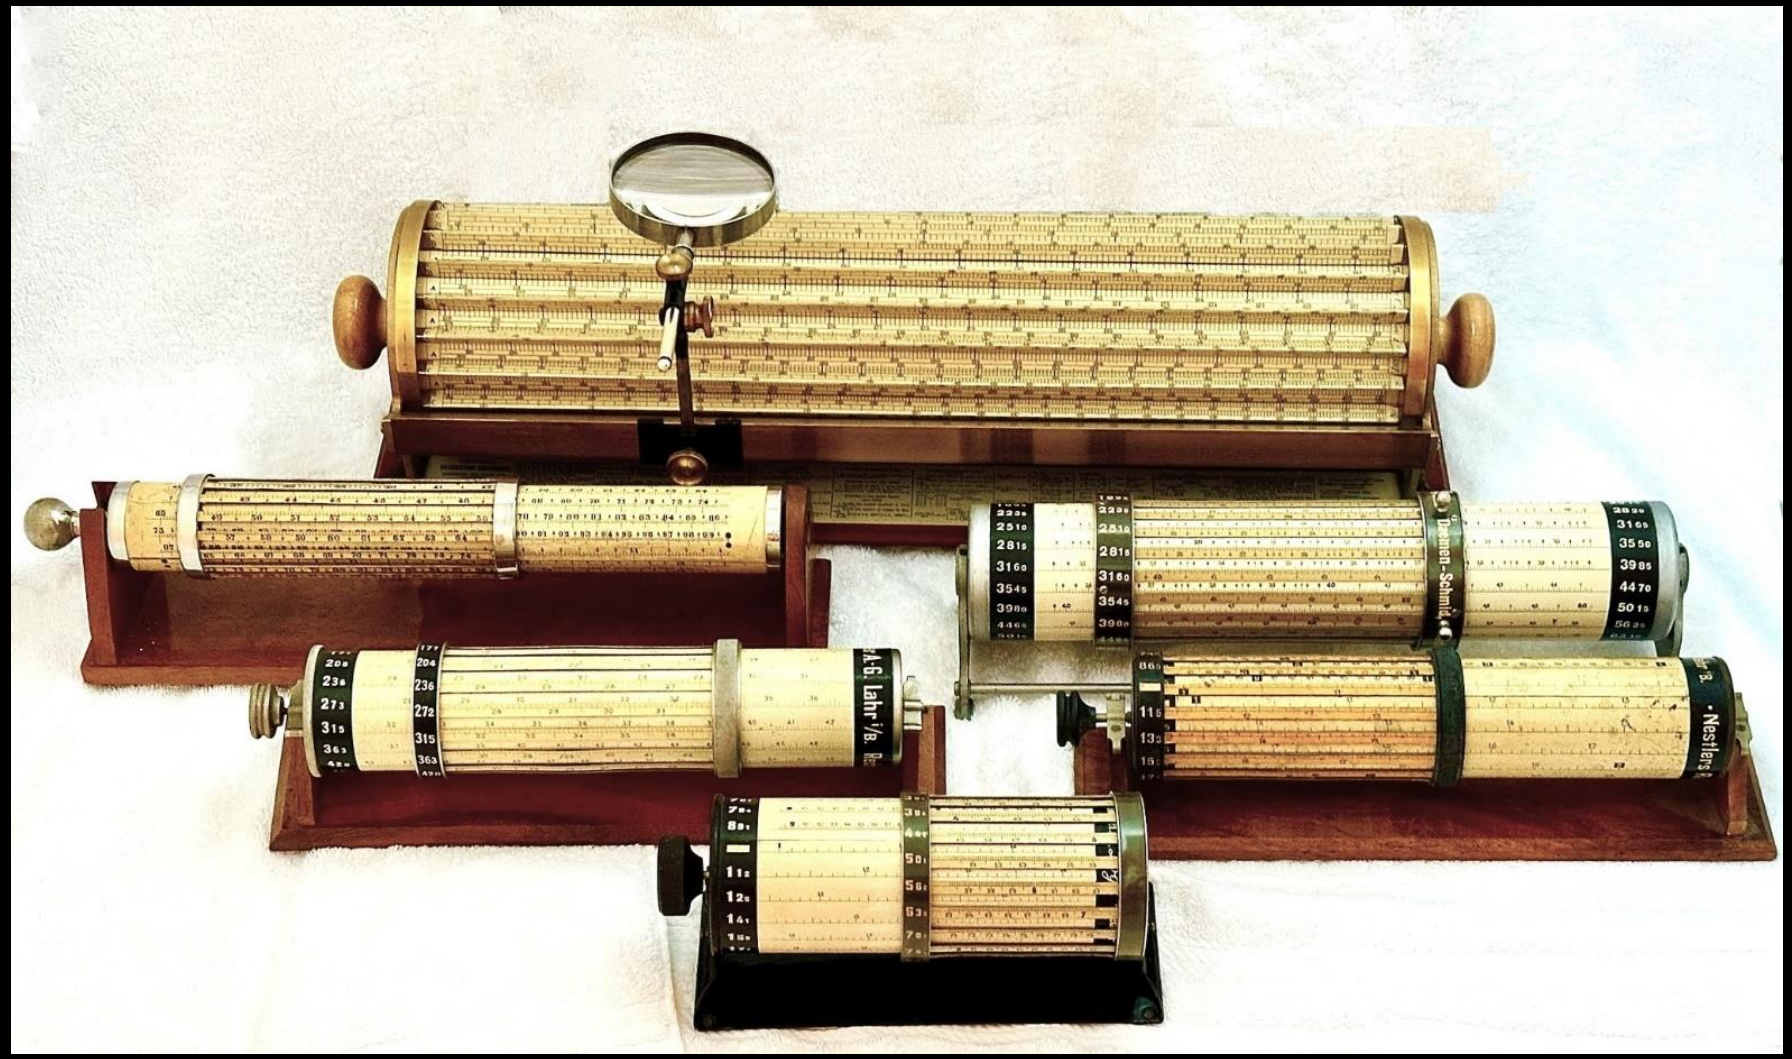
Different Varieties of Circular Rules Manufactured Over the Years...

William Oughtred's Legacy.....

...and, of course, cylindrical slide rules of all types and sizes.....

William Oughtred's Legacy.....

.....and more cylinders.....



INTERNATIONAL MEETING 2025
Cambridge/Boston MA

Some Interesting Specialized Slide Rules....
.....and Some Significant 'First's'

INTERNATIONAL MEETING 2025
Cambridge/Boston MA

John Suxspeach and the Catholic Organon, 1753

- Schoolmaster from Middlesex, England ,invented and had manufactured what is likely the most complete and complex slide rule ever developed..
- Total of 86 scales cover the areas of gauging, navigation, mathematics, astronomy, dialing (determining position with sundial and astrolabe),, and other areas..

Some Interesting Specialized Slide Rules....

.....and Some Significant 'First's'

John Suxspeach and the Catholic Organon, 1753

- Schoolmaster from Middlesex, England ,invented and had manufactured what is likely the most complete and complex slide rule ever developed..
- Total of 86 scales cover the areas of gauging, navigation, mathematics, astronomy, dialing (determining position with sundial and astrolabe),, and other areas.
- **Original invention also included a telescope which fits into the middle of the octagonal slide within the rule.**
- **Granted Patent No. 676 for his Catholic Organon ('all inclusive instrument for acquiring knowledge') on 29 March 1753, first patent ever granted on a slide rule.**

Some Interesting Specialized Slide Rules....
.....and Some Significant 'First's'

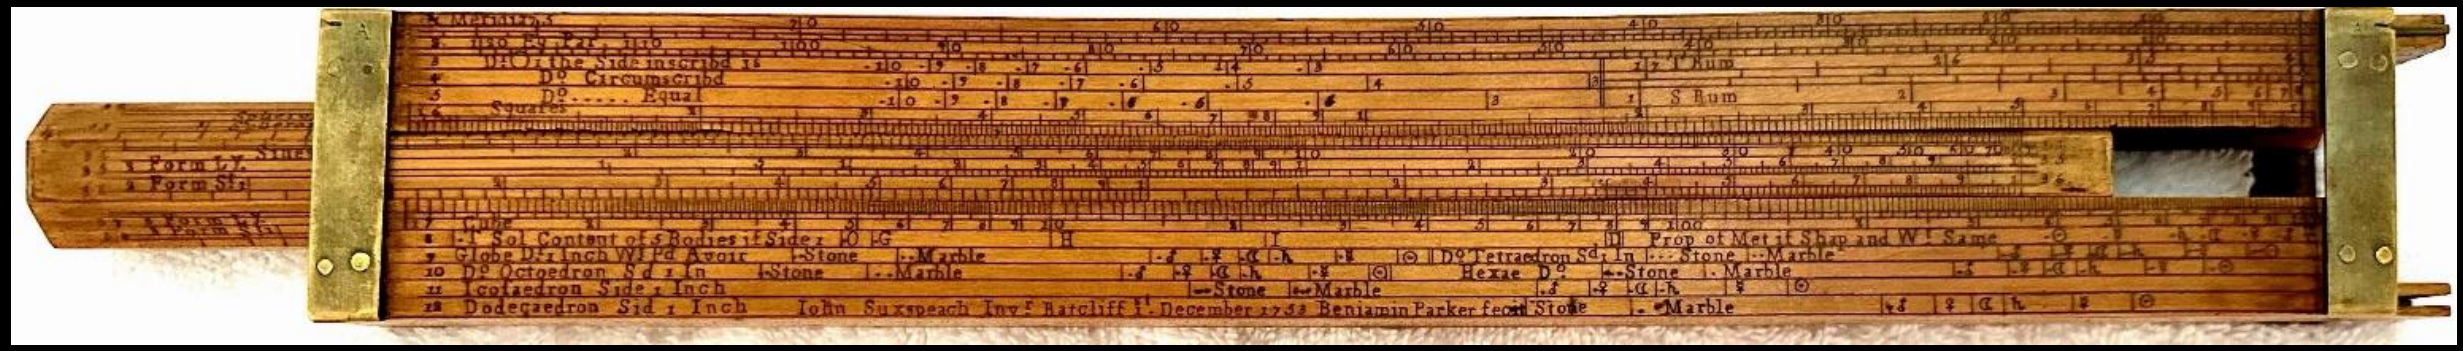
John Suxspeach and the Catholic Organon, 1753

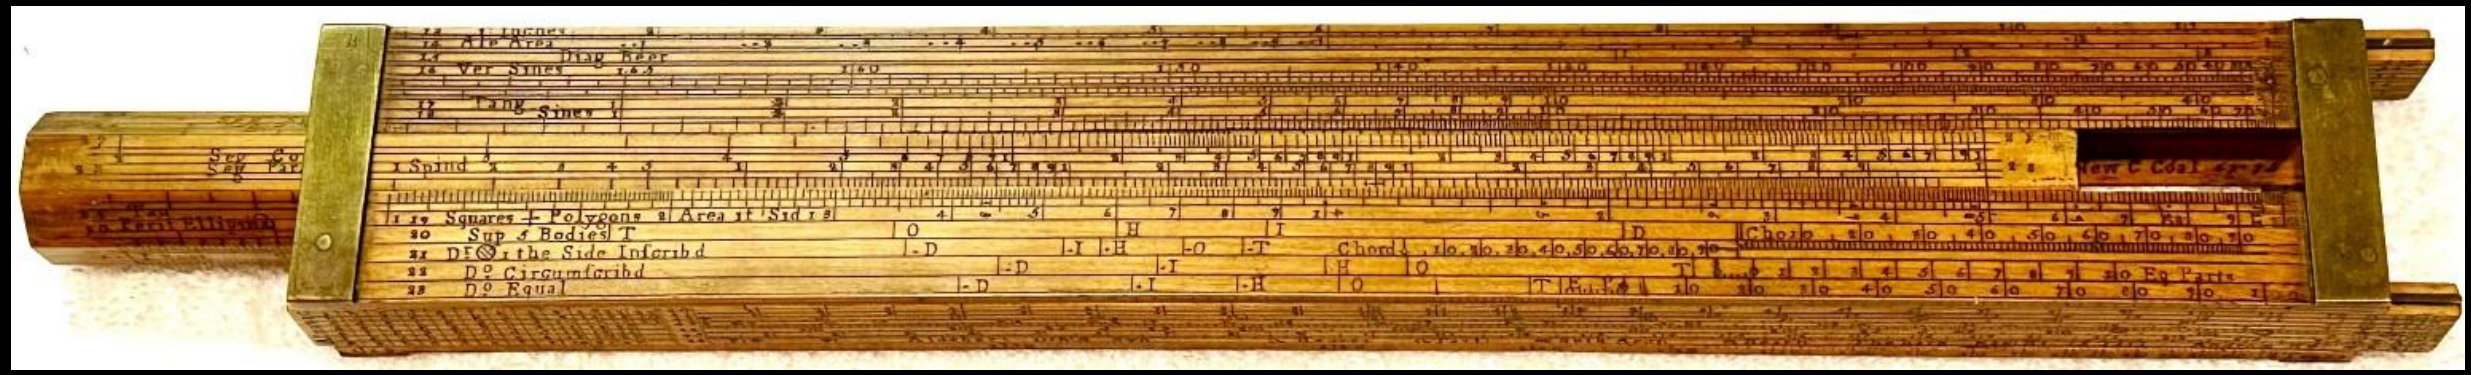
- Schoolmaster from Middlesex, England ,invented and had manufactured what is likely the most complete and complex slide rule ever developed..
- Total of 86 scales cover the areas of gauging, navigation, mathematics, astronomy, dialing (determining position with sundial and astrolabe),, and other areas.
- Original invention also included a telescope which fits into the middle of the octagonal slide within the rule.
- Granted Patent No. 676 for his Catholic Organon ('all inclusive instrument for acquiring knowledge') on 29 March 1753, first patent ever granted on a slide rule.
- Peter Hopp's research indicates up to 16 examples were made, each numbered and dated between 1 September 1752 and the last known number 16, case only, in 1755.

Some Interesting Specialized Slide Rules....

.....and Some Significant 'First's'

John Suxspeach and the Catholic Organon, 1753

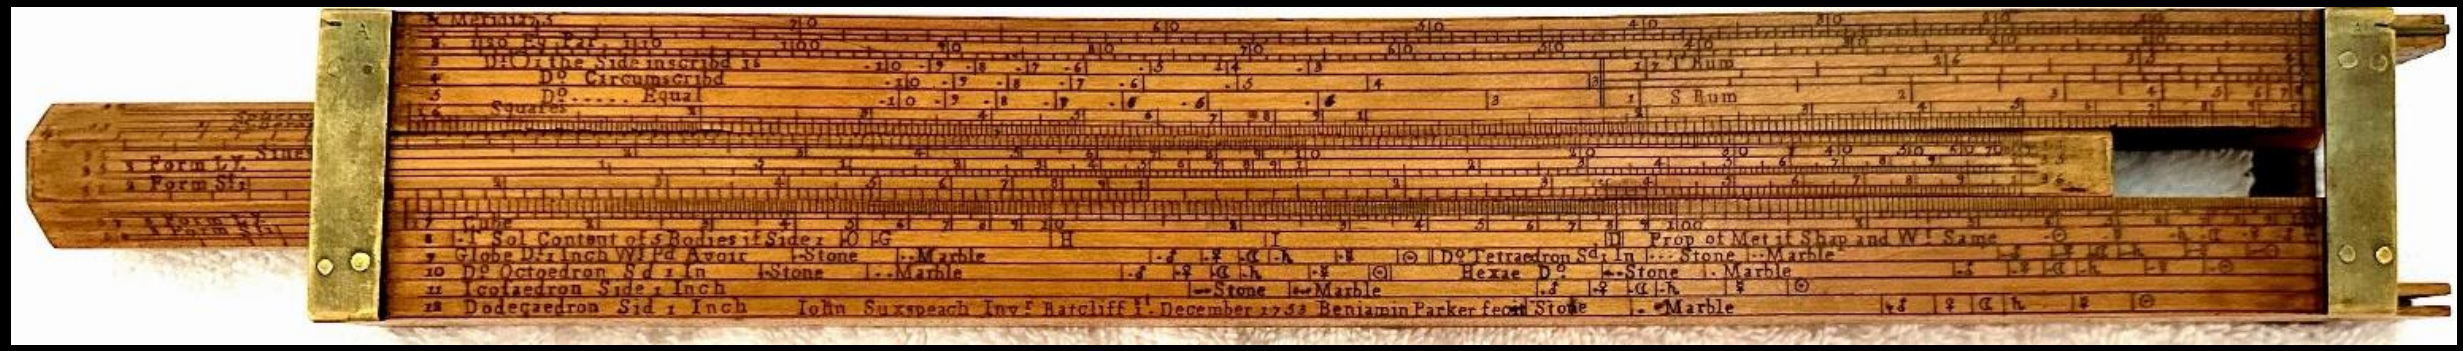


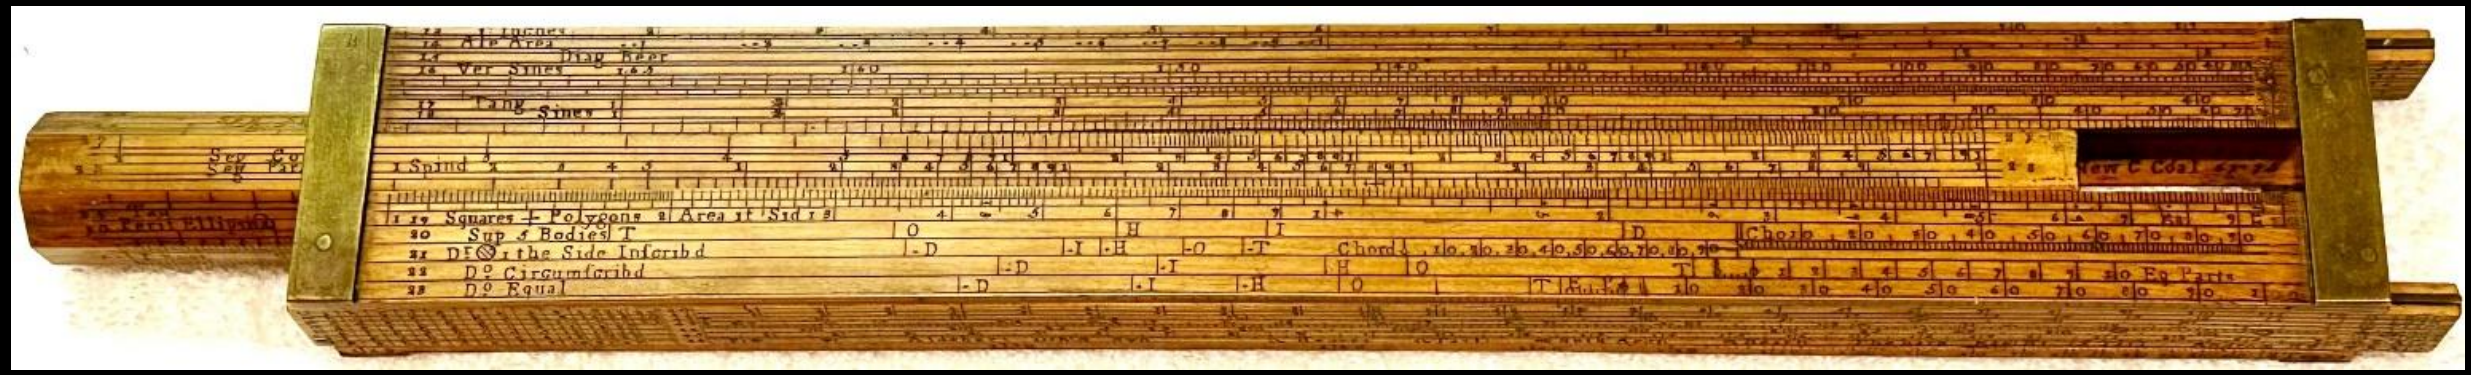


Some Interesting Specialized Slide Rules....

.....and Some Significant 'First's'

John Suxspeach and the Catholic Organon, 1753





As of Oct 2025, seven examples have been identified, four in museum collections [Museum of History of Science in Oxford, Whipple Museum in Cambridge, Macleay Museum in Sydney, Arithmeum in Bonn], three in private collections.

Some Interesting Specialized Slide Rules....

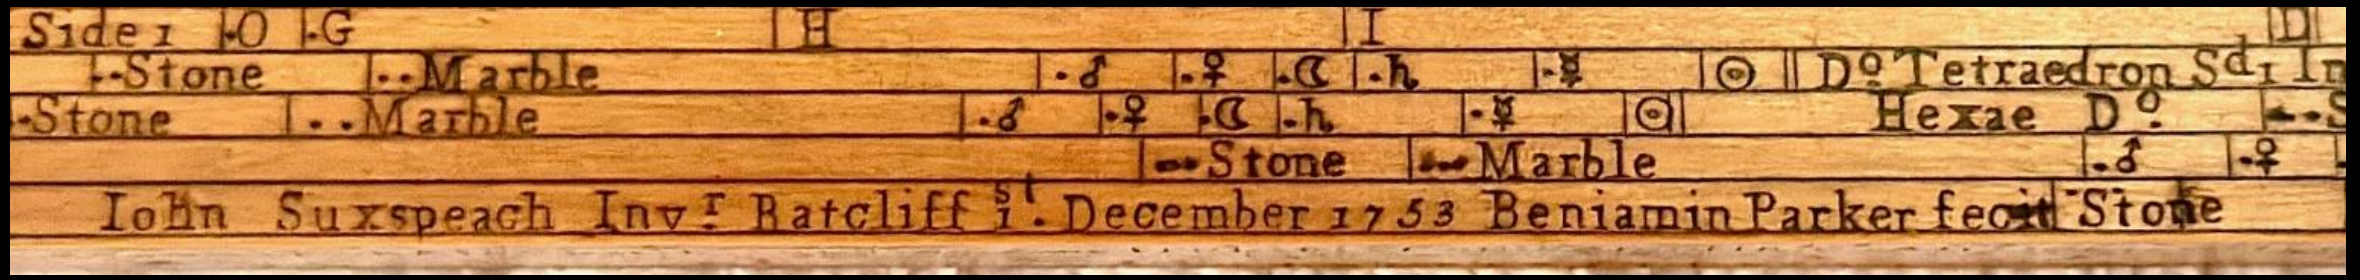
.....and Some Significant 'First's'

John Suxspeach and the Catholic Organon, 1753

Some Interesting Specialized Slide Rules....

.....and Some Significant 'First's'

John Suxspeach and the Catholic Organon, 1753



Some Interesting Specialized Slide Rules....

.....and Some Significant 'First's'

Palmer's Computing Scale, 1841, Aaron Palmer and George G. Smith

Some Interesting Specialized Slide Rules....

.....and Some Significant 'First's'

Palmer's Computing Scale, 1841, Aaron Palmer and George G. Smith

Widely recognized as the first slide rule manufactured in the United States, prototype 1841, copyrighted in 1843

Additional Fuller's Time Telegraph added in 1845 (John E. Fuller)

Rule did not sell as well as expected and Palmer considered the venture a failure.

General acceptance of the use of a slide rule did not occur until the 1880's in America, a more than 40 year gap from the introduction of the Palmer's Scale

Some Interesting Specialized Slide Rules....

.....and Some Significant 'First's'

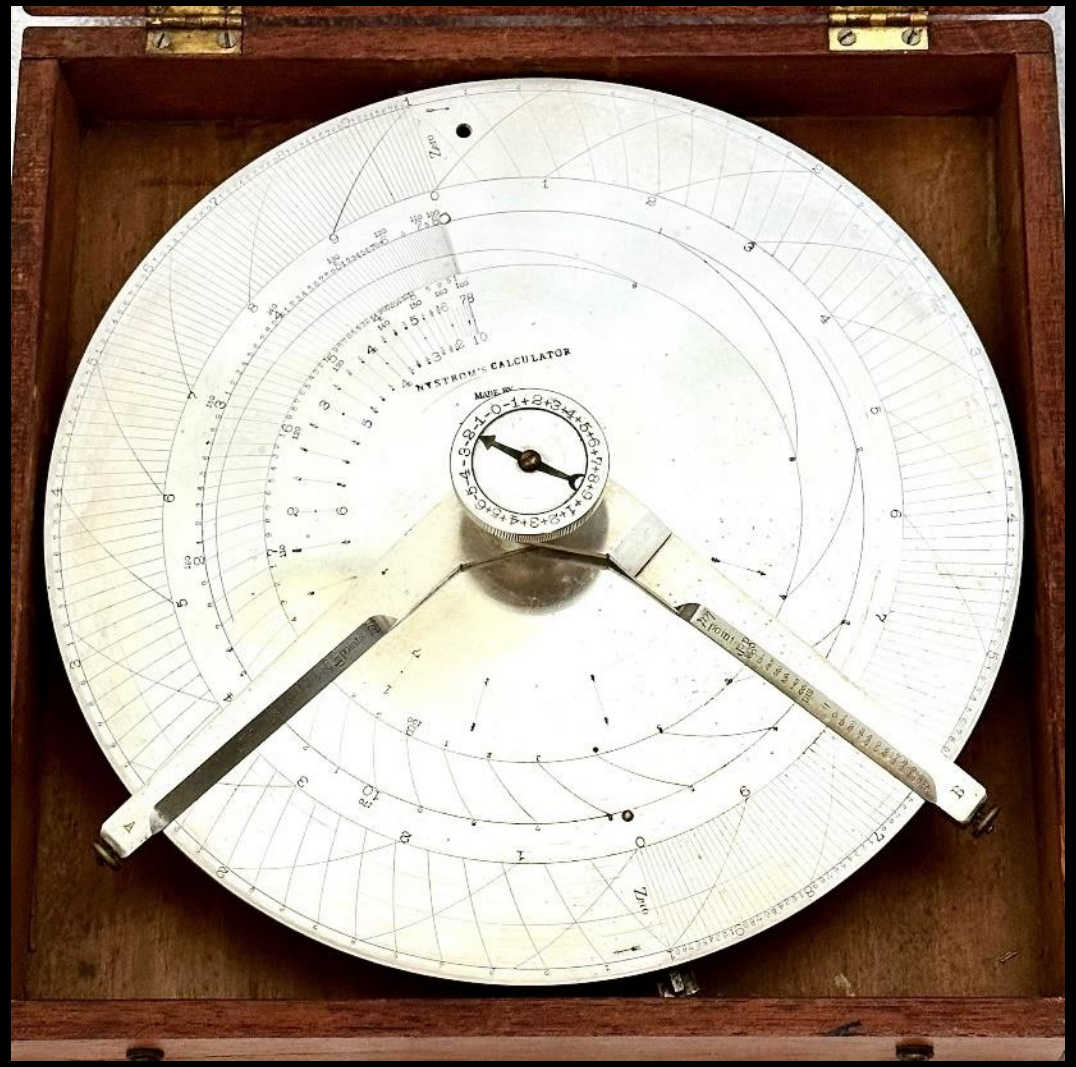
Nystrom's Calculator, 1851, John W. Nystrom (1825 – 1885)

INTERNATIONAL MEETING 2025
Cambridge/Boston MA

Some Interesting Specialized Slide Rules....

.....and Some Significant 'First's'

Nystrom's Calculator, 1851, John W. Nystrom (1825 – 1885)

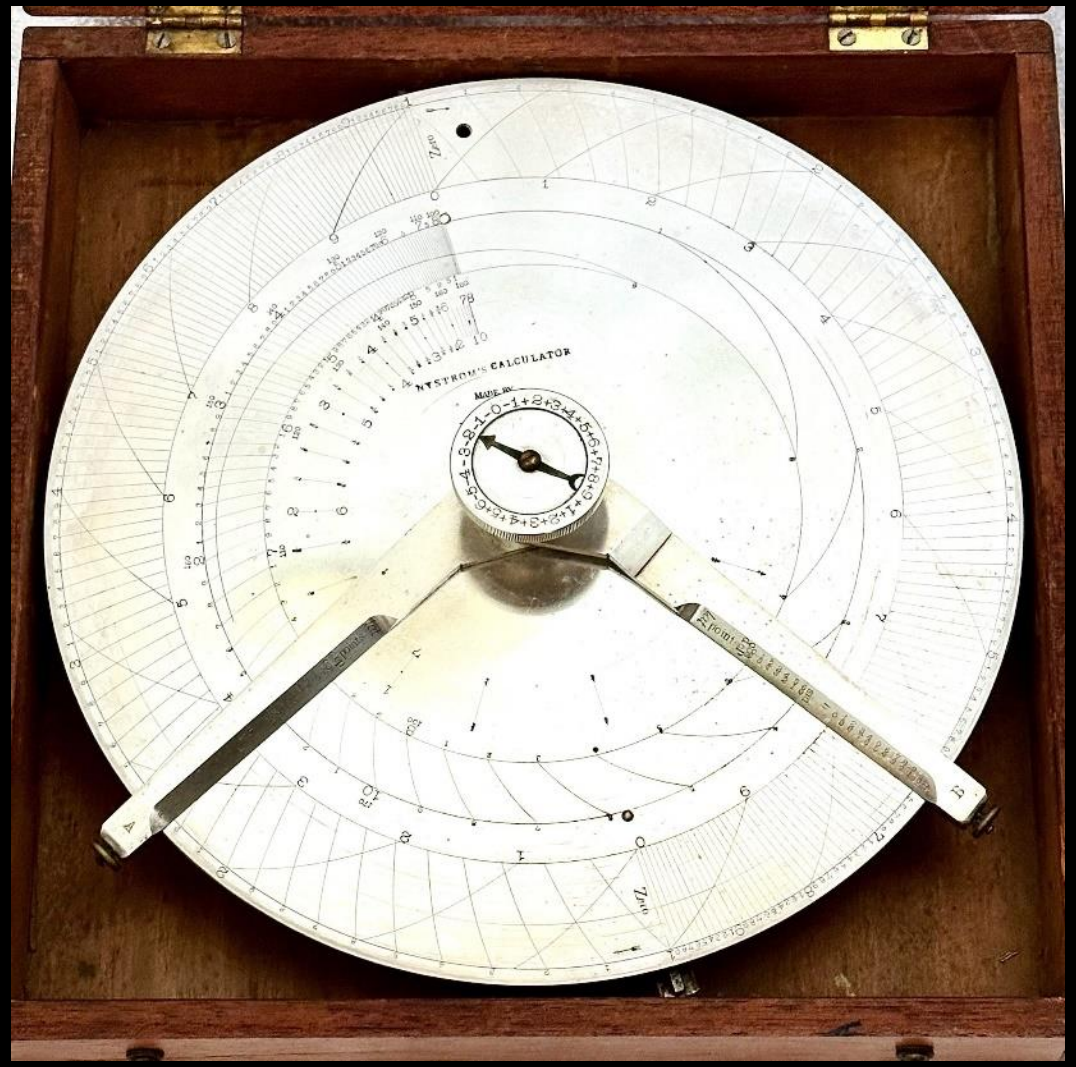


Some Interesting Specialized Slide Rules....

.....and Some Significant 'First's'

Nystrom's Calculator, 1851, John W. Nystrom (1825 – 1885)

First patented American slide rule,
US Patent No. 7961 March 4, 1851



Some Interesting Specialized Slide Rules....

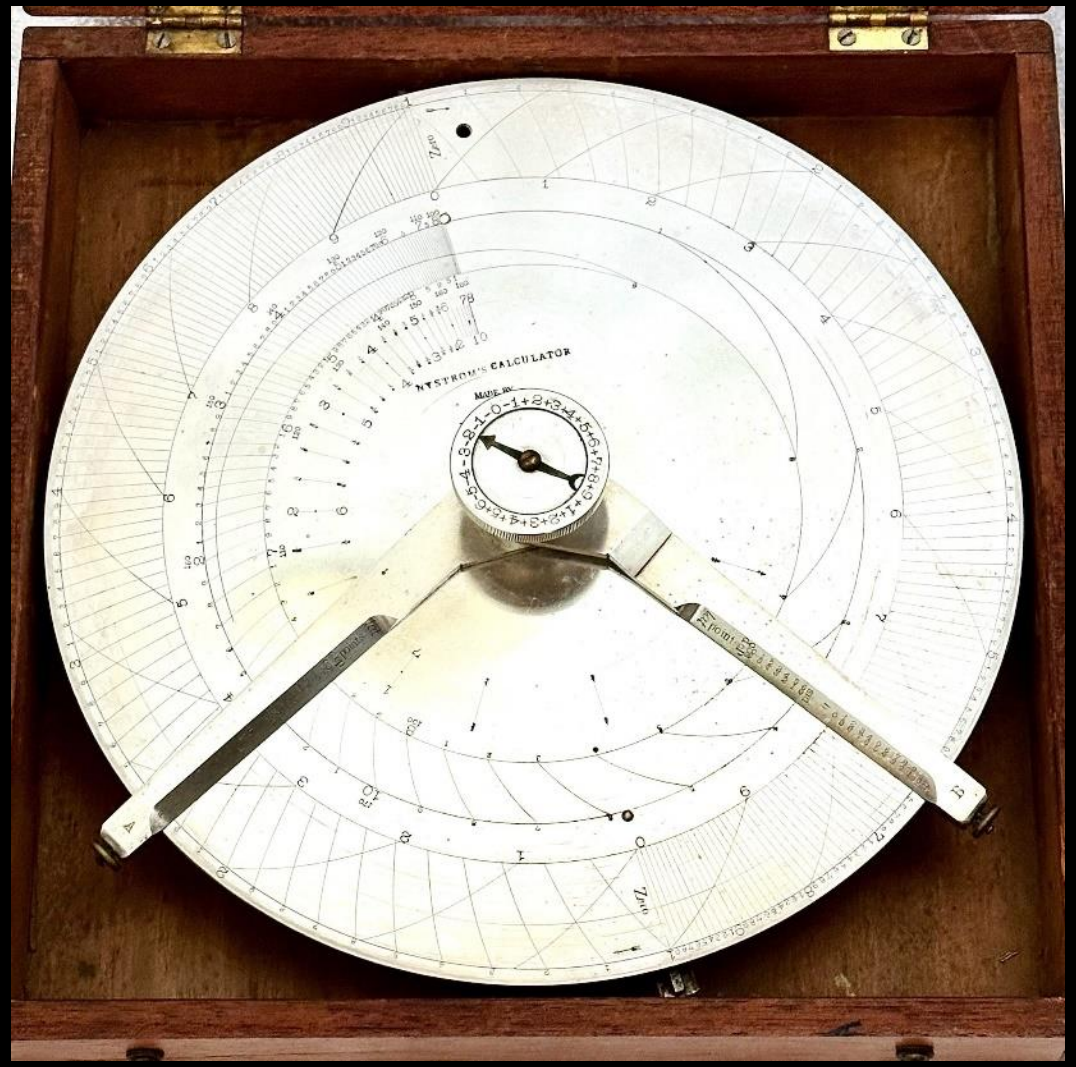
.....and Some Significant 'First's'

Nystrom's Calculator, 1851, John W. Nystrom (1825 – 1885)

First patented American slide rule, US Patent No. 7961 March 4, 1851

Received many awards and high praise but at $20 it was not successful as a commercial venture

Less than 100 were ever sold; five are firmly identified today, three in museums [patent model Smithsonian National Museum of American History, University of Mississippi Museum in Oxford MI, Arithmeum in Bonn], two in private collections



Summary and Some Final Thoughts

- **Invention of logarithms is a top mathematical achievement of the past 1000 years. Critical in simplifying and speeding complex and precise calculations required in astronomy, they become a key tool of the Scientific Revolution.**
- **Edmund Gunter recognizes that a scale calibrated logarithmically can be a very useful tool for navigation,, where often extreme precision is not necessary.**

Summary and Some Final Thoughts

- **Invention of logarithms is a top mathematical achievement of the past 1000 years. Critical in simplifying and speeding complex and precise calculations required in astronomy, they become a key tool of the Scientific Revolution.**
- **Edmund Gunter recognizes that a scale calibrated logarithmically can be a very useful tool for navigation,, where often extreme precision is not necessary.**

Summary and Some Final Thoughts

- Invention of logarithms is a top mathematical achievement of the past 1000 years. Critical in simplifying and speeding complex and precise calculations required in astronomy, they become a key tool of the Scientific Revolution.
- Edmund Gunter recognizes that a scale calibrated logarithmically can be a very useful tool for navigation,, where often extreme precision is not necessary.
- William Oughtred conceives of his Circle of Proportions in the 1620's and his work is published in 1632, but not before his pupil Richard Delamain publishes a pamphlet claiming prior invention of the slide rule, leading to a bitter debate for the next decade. Oughtred also invents a linear slide rule in the early 1630's. Delamain becomes the King's tutor.
- Oughtred and his supporters are able to verify through documentation to several mathematicians, and including tool maker Elias Allen, that he was first to conceive of the idea.

Summary and Some Final Thoughts

- **Over the next 350 years, slide rules become a key tool of the Industrial Revolution.**
- **Rules are developed for the timber trade, calculating excise taxes, navigation, dialing, efficient steam engines, building buildings and bridges, and many other trades, eventually in sending a man to the moon. and many other trades. Slide rules become a key tool of the Industrial Revolution.**

Summary and Some Final Thoughts

- Over the next 350 years, slide rules become a key tool of the Industrial Revolution.
- Rules are developed for the timber trade, calculating excise taxes, navigation, dialing, efficient steam engines, building buildings and bridges, and many other trades, eventually in sending a man to the moon. and many other trades. Slide rules become a key tool of the Industrial Revolution.

- The very technological revolution that the slide rule helped to fuel eventually set the expiration date for its demise.
- Advent of the inexpensive hand held calculators in the 1970's brought 350 years of continuous development and variety to an abrupt and conclusive end.
- **But for us, these rules are exceptional works of technology... yes, even beautiful works of art....a lasting testament that continues to flourish and be very much appreciated and admired to this day!**
